# **I. SDL Guide**

# Preface

## About SDL

The SDL library is designed to make it easy to write games that run on Linux, \*BSD, MacOS, Win32 and BeOS using the various native high-performance media interfaces, (for video, audio, etc) and presenting a single source-code level API to your application. SDL is a fairly low level API, but using it, completely portable applications can be written with a great deal of flexibility.

## About SDLdoc

SDLdoc (The SDL Documentation Project) was formed to completely rewrite the SDL documentation and to keep it continually up to date. The team consists completely of volunteers ranging from people working with SDL in their spare time to people who use SDL in their everyday working lives.

The latest version of this documentation can always be found here: <http://sdl.doc.csn.ul.ie>  
Downloadable PS, man pages and html tarballs are available at <http://sdl.doc.csn.ul.ie/pub/>

# Chapter 1. The Basics

## Introduction

The SDL Guide section is pretty incomplete. If you feel you have anything to add mail [akawaka@skynet.ie](mailto:akawaka@skynet.ie) or visit <http://akawaka.csn.ul.ie/tne/>.

## Initializing SDL

SDL is composed of eight subsystems - Audio, CDROM, Event Handling, File I/O, Joystick Handling, Threading, Timers and Video. Before you can use any of these subsystems they must be initialized by calling `SDL_Init` (or `SDL_InitSubSystem`. `SDL_Init` must be called before any other SDL function. It automatically initializes the Event Handling, File I/O and Threading subsystems and it takes a parameter specifying which other subsystems to initialize. So, to initialize the default subsystems and the Video subsystems you would call:

```
SDL_Init ( SDL_INIT_VIDEO );
```

To initialize the default subsystems, the Video subsystem and the Timers subsystem you would call:

```
SDL_Init ( SDL_INIT_VIDEO | SDL_INIT_TIMER );
```

`SDL_Init` is complemented by `SDL_Quit` (and `SDL_QuitSubSystem`). `SDL_Quit` shuts down all subsystems, including the default ones. It should always be called before a SDL application exits.

With `SDL_Init` and `SDL_Quit` firmly embedded in your programmers toolkit you can write your first and most basic SDL application. However, we must be prepare to handle errors. Many SDL functions return a value and indicates whether the function has succeeded or failed, `SDL_Init`, for instance, returns -1 if it could not initialize a subsystem. SDL provides a useful facility that allows you to determine exactly what the problem was, every time an error occurs within SDL an error message is stored which can be retrieved using `SDL_GetError`. Use this often, you can never know too much about an error.

### Example 1-1. Initializing SDL

```
#include "SDL.h"    /* All SDL App's need this */
#include <stdio.h>

int main() {

    printf("Initializing SDL.\n");
```

```
/* Initialize defaults, Video and Audio */
if((SDL_Init(SDL_INIT_VIDEO|SDL_INIT_AUDIO)==-1)) {
    printf("Could not initialize SDL: %s.\n", SDL_GetError());
    exit(-1);
}

printf("SDL initialized.\n");

printf("Quiting SDL.\n");

/* Shutdown all subsystems */
SDL_Quit();

printf("Quiting....\n");

exit(0);
}
```

# Chapter 2. Graphics and Video

## Introduction to SDL Video

Video is probably the most common thing that SDL is used for, and so it has the most complete subsystem. Here are a few examples to demonstrate the basics.

### Initializing the Video Display

This is what almost all SDL programs have to do in one way or another.

#### Example 2-1. Initializing the Video Display

```
SDL_Surface *screen;

/* Initialize the SDL library */
if( SDL_Init(SDL_INIT_VIDEO) < 0 ) {
    fprintf(stderr,
        "Couldn't initialize SDL: %s\n", SDL_GetError());
    exit(1);
}

/* Clean up on exit */
atexit(SDL_Quit);

/*
 * Initialize the display in a 640x480 8-bit palettized mode,
 * requesting a software surface
 */
screen = SDL_SetVideoMode(640, 480, 8, SDL_SWSURFACE);
if ( screen == NULL ) {
    fprintf(stderr, "Couldn't set 640x480x8 video mode: %s\n",
        SDL_GetError());
    exit(1);
}
```

### Initializing the Best Video Mode

If you have a preference for a certain pixel depth but will accept any other, use `SDL_SetVideoMode` with `SDL_ANYFORMAT` as below. You can also use `SDL_VideoModeOK()` to find the native video mode that is closest to the mode you request.

**Example 2-2. Initializing the Best Video Mode**

```

/* Have a preference for 8-bit, but accept any depth */
screen = SDL_SetVideoMode(640, 480, 8, SDL_SWSURFACE|SDL_ANYFORMAT);
if ( screen == NULL ) {
    fprintf(stderr, "Couldn't set 640x480x8 video mode: %s\n",
              SDL_GetError());
    exit(1);
}
printf("Set 640x480 at %d bits-per-pixel mode\n",
       screen->format->BitsPerPixel);

```

**Loading and Displaying a BMP File**

The following function loads and displays a BMP file given as argument, once SDL is initialised and a video mode has been set.

**Example 2-3. Loading and Displaying a BMP File**

```

void display_bmp(char *file_name)
{
    SDL_Surface *image;

    /* Load the BMP file into a surface */
    image = SDL_LoadBMP(file_name);
    if (image == NULL) {
        fprintf(stderr, "Couldn't load %s: %s\n", file_name, SDL_GetError());
        return;
    }

    /*
     * Palettized screen modes will have a default palette (a standard
     * 8*8*4 colour cube), but if the image is palettized as well we can
     * use that palette for a nicer colour matching
     */
    if (image->format->palette && screen->format->palette) {
        SDL_SetColors(screen, image->format->palette->colors, 0,
                     image->format->palette->ncolors);
    }

    /* Blit onto the screen surface */
    if(SDL_BlitSurface(image, NULL, screen, NULL) < 0)
        fprintf(stderr, "BlitSurface error: %s\n", SDL_GetError());

    SDL_UpdateRect(screen, 0, 0, image->w, image->h);

    /* Free the allocated BMP surface */
}

```

```

        SDL_FreeSurface(image);
    }

```

## Drawing Directly to the Display

The following two functions can be used to get and set single pixels of a surface. They are carefully written to work with any depth currently supported by SDL. Remember to lock the surface before calling them, and to unlock it before calling any other SDL functions.

To convert between pixel values and their red, green, blue components, use `SDL_GetRGB()` and `SDL_MapRGB()`.

### Example 2-4. `getpixel()`

```

/*
 * Return the pixel value at (x, y)
 * NOTE: The surface must be locked before calling this!
 */
Uint32 getpixel(SDL_Surface *surface, int x, int y)
{
    int bpp = surface->format->BytesPerPixel;
    /* Here p is the address to the pixel we want to retrieve */
    Uint8 *p = (Uint8 *)surface->pixels + y * surface->pitch + x * bpp;

    switch(bpp) {
    case 1:
        return *p;

    case 2:
        return *(Uint16 *)p;

    case 3:
        if(SDL_BYTEORDER == SDL_BIG_ENDIAN)
            return p[0] << 16 | p[1] << 8 | p[2];
        else
            return p[0] | p[1] << 8 | p[2] << 16;

    case 4:
        return *(Uint32 *)p;

    default:
        return 0;          /* shouldn't happen, but avoids warnings */
    }
}

```

**Example 2-5. putpixel()**

```

/*
 * Set the pixel at (x, y) to the given value
 * NOTE: The surface must be locked before calling this!
 */
void putpixel(SDL_Surface *surface, int x, int y, Uint32 pixel)
{
    int bpp = surface->format->BytesPerPixel;
    /* Here p is the address to the pixel we want to set */
    Uint8 *p = (Uint8 *)surface->pixels + y * surface->pitch + x * bpp;

    switch(bpp) {
    case 1:
        *p = pixel;
        break;

    case 2:
        *(Uint16 *)p = pixel;
        break;

    case 3:
        if(SDL_BYTEORDER == SDL_BIG_ENDIAN) {
            p[0] = (pixel >> 16) & 0xff;
            p[1] = (pixel >> 8) & 0xff;
            p[2] = pixel & 0xff;
        } else {
            p[0] = pixel & 0xff;
            p[1] = (pixel >> 8) & 0xff;
            p[2] = (pixel >> 16) & 0xff;
        }
        break;

    case 4:
        *(Uint32 *)p = pixel;
        break;
    }
}

```

The following code uses the `putpixel()` function above to set a yellow pixel in the middle of the screen.

**Example 2-6. Using putpixel()**

```

/* Code to set a yellow pixel at the center of the screen */

int x, y;
Uint32 yellow;

```

```

/* Map the color yellow to this display (R=0xff, G=0xFF, B=0x00)
   Note: If the display is palettized, you must set the palette first.
*/
yellow = SDL_MapRGB(screen->format, 0xff, 0xff, 0x00);

x = screen->w / 2;
y = screen->h / 2;

/* Lock the screen for direct access to the pixels */
if ( SDL_MUSTLOCK(screen) ) {
    if ( SDL_LockSurface(screen) < 0 ) {
        fprintf(stderr, "Can't lock screen: %s\n", SDL_GetError());
        return;
    }
}

putpixel(screen, x, y, yellow);

if ( SDL_MUSTLOCK(screen) ) {
    SDL_UnlockSurface(screen);
}
/* Update just the part of the display that we've changed */
SDL_UpdateRect(screen, x, y, 1, 1);

return;

```

## Using OpenGL With SDL

SDL has the ability to create and use OpenGL contexts on several platforms (Linux/X11, Win32, BeOS, MacOS Classic/Toolbox, MacOS X, FreeBSD/X11 and Solaris/X11). This allows you to use SDL's audio, event handling, threads and times in your OpenGL applications (a function often performed by GLUT).

### Initialisation

Initialising SDL to use OpenGL is not very different to initialising SDL normally. There are three differences; you must pass `SDL_OPENGL` to `SDL_SetVideoMode`, you must specify several GL attributes (depth buffer size, framebuffer sizes) using `SDL_GL_SetAttribute` and finally, if you wish to use double buffering you must specify it as a GL attribute, *not* by passing the `SDL_DOUBLEBUF` flag to `SDL_SetVideoMode`.

**Example 2-7. Initializing SDL with OpenGL**

```

/* Information about the current video settings. */
const SDL_VideoInfo* info = NULL;
/* Dimensions of our window. */
int width = 0;
int height = 0;
/* Color depth in bits of our window. */
int bpp = 0;
/* Flags we will pass into SDL_SetVideoMode. */
int flags = 0;

/* First, initialize SDL's video subsystem. */
if( SDL_Init( SDL_INIT_VIDEO ) < 0 ) {
    /* Failed, exit. */
    fprintf( stderr, "Video initialization failed: %s\n",
            SDL_GetError( ) );
    quit_tutorial( 1 );
}

/* Let's get some video information. */
info = SDL_GetVideoInfo( );

if( !info ) {
    /* This should probably never happen. */
    fprintf( stderr, "Video query failed: %s\n",
            SDL_GetError( ) );
    quit_tutorial( 1 );
}

/*
 * Set our width/height to 640/480 (you would
 * of course let the user decide this in a normal
 * app). We get the bpp we will request from
 * the display. On X11, VidMode can't change
 * resolution, so this is probably being overly
 * safe. Under Win32, ChangeDisplaySettings
 * can change the bpp.
 */
width = 640;
height = 480;
bpp = info->vfmt->BitsPerPixel;

/*
 * Now, we want to setup our requested
 * window attributes for our OpenGL window.
 * We want *at least* 5 bits of red, green
 * and blue. We also want at least a 16-bit
 * depth buffer.

```

```

*
* The last thing we do is request a double
* buffered window. '1' turns on double
* buffering, '0' turns it off.
*
* Note that we do not use SDL_DOUBLEBUF in
* the flags to SDL_SetVideoMode. That does
* not affect the GL attribute state, only
* the standard 2D blitting setup.
*/
SDL_GL_SetAttribute( SDL_GL_RED_SIZE, 5 );
SDL_GL_SetAttribute( SDL_GL_GREEN_SIZE, 5 );
SDL_GL_SetAttribute( SDL_GL_BLUE_SIZE, 5 );
SDL_GL_SetAttribute( SDL_GL_DEPTH_SIZE, 16 );
SDL_GL_SetAttribute( SDL_GL_DOUBLEBUFFER, 1 );

/*
* We want to request that SDL provide us
* with an OpenGL window, in a fullscreen
* video mode.
*
* EXERCISE:
* Make starting windowed an option, and
* handle the resize events properly with
* glViewport.
*/
flags = SDL_OPENGL | SDL_FULLSCREEN;

/*
* Set the video mode
*/
if( SDL_SetVideoMode( width, height, bpp, flags ) == 0 ) {
    /*
    * This could happen for a variety of reasons,
    * including DISPLAY not being set, the specified
    * resolution not being available, etc.
    */
    fprintf( stderr, "Video mode set failed: %s\n",
             SDL_GetError( ) );
    quit_tutorial( 1 );
}

```

## Drawing

Apart from initialisation, using OpenGL within SDL is the same as using OpenGL with any other API, e.g. GLUT. You still use all the same function calls and data types. However if you are using a double-buffered display, then you must use `SDL_GL_SwapBuffers( )` to swap the buffers and

update the display. To request double-buffering with OpenGL, use `SDL_GL_SetAttribute` with `SDL_GL_DOUBLEBUFFER`, and use `SDL_GL_GetAttribute` to see if you actually got it.

A full example code listing is now presented below.

#### Example 2-8. SDL and OpenGL

```
/*
 * SDL OpenGL Tutorial.
 * (c) Michael Vance, 2000
 * briareos@lokigames.com
 *
 * Distributed under terms of the LGPL.
 */

#include <SDL/SDL.h>
#include <GL/gl.h>
#include <GL/glu.h>

#include <stdio.h>
#include <stdlib.h>

static GLboolean should_rotate = GL_TRUE;

static void quit_tutorial( int code )
{
    /*
     * Quit SDL so we can release the fullscreen
     * mode and restore the previous video settings,
     * etc.
     */
    SDL_Quit( );

    /* Exit program. */
    exit( code );
}

static void handle_key_down( SDL_keysym* keysym )
{
    /*
     * We're only interested if 'Esc' has
     * been pressed.
     *
     * EXERCISE:
     * Handle the arrow keys and have that change the
     * viewing position/angle.
     */
    switch( keysym->sym ) {
```

```

        case SDLK_ESCAPE:
            quit_tutorial( 0 );
            break;
        case SDLK_SPACE:
            should_rotate = !should_rotate;
            break;
        default:
            break;
    }
}

static void process_events( void )
{
    /* Our SDL event placeholder. */
    SDL_Event event;

    /* Grab all the events off the queue. */
    while( SDL_PollEvent( &event ) ) {

        switch( event.type ) {
        case SDL_KEYDOWN:
            /* Handle key presses. */
            handle_key_down( &event.key.keysym );
            break;
        case SDL_QUIT:

# Chapter 3. Input handling

## Handling Joysticks

### Initialization

The first step in using a joystick in a SDL program is to initialize the Joystick subsystems of SDL. This is done by passing the `SDL_INIT_JOYSTICK` flag to `SDL_Init`. The joystick flag will usually be used in conjunction with other flags (like the video flag) because the joystick is usually used to control something.

#### Example 3-1. Initializing SDL with Joystick Support

```
if ( ! SDL_Init( SDL_INIT_VIDEO | SDL_INIT_JOYSTICK ) )
{
    fprintf(stderr, "Couldn't initialize SDL: %s\n", SDL_GetError());
    exit(1);
}
```

This will attempt to start SDL with both the video and the joystick subsystems activated.

### Querying

If we have reached this point then we can safely assume that the SDL library has been initialized and that the Joystick subsystem is active. We can now call some video and/or sound functions to get things going before we need the joystick. Eventually we have to make sure that there is actually a joystick to work with. It's wise to always check even if you know a joystick will be present on the system because it can also help detect when the joystick is unplugged. The function used to check for joysticks is `SDL_NumJoysticks`.

This function simply returns the number of joysticks available on the system. If it is at least one then we are in good shape. The next step is to determine which joystick the user wants to use. If the number of joysticks available is only one then it is safe to assume that one joystick is the one the user wants to use. SDL has a function to get the name of the joysticks as assigned by the operations system and that function is `SDL_JoystickName`. The joystick is specified by an index where 0 is the first joystick and the last joystick is the number returned by `SDL_NumJoysticks` - 1. In the demonstration a list of all available joysticks is printed to stdout.

#### Example 3-2. Querying the Number of Available Joysticks

```
printf("%i joysticks were found.\n\n", SDL_NumJoysticks() );
printf("The names of the joysticks are:\n");
```

```

for( i=0; i < SDL_NumJoysticks(); i++ )
{
    printf("    %s\n", SDL_JoystickName(i));
}

```

## Opening a Joystick and Receiving Joystick Events

SDL's event driven architecture makes working with joysticks a snap. Joysticks can trigger 4 different types of events:

SDL_JoyAxisEvent	Occurs when an axis changes
SDL_JoyBallEvent	Occurs when a joystick trackball's position changes
SDL_JoyHatEvent	Occurs when a hat's position changes
SDL_JoyButtonEvent	Occurs when a button is pressed or released

Events are received from all joysticks opened. The first thing that needs to be done in order to receive joystick events is to call `SDL_JoystickEventState` with the `SDL_ENABLE` flag. Next you must open the joysticks that you want to receive events from. This is done with the `SDL_JoystickOpen` function. For the example we are only interested in events from the first joystick on the system, regardless of what it may be. To receive events from it we would do this:

### Example 3-3. Opening a Joystick

```

SDL_Joystick *joystick;

SDL_JoystickEventState(SDL_ENABLE);
joystick = SDL_JoystickOpen(0);

```

If we wanted to receive events for other joysticks we would open them with calls to `SDL_JoystickOpen` just like we opened joystick 0, except we would store the `SDL_Joystick` structure they return in a different pointer. We only need the joystick pointer when we are querying the joysticks or when we are closing the joystick.

Up to this point all the code we have is used just to initialize the joysticks in order to read values at run time. All we need now is an event loop, which is something that all SDL programs should have anyway to receive the systems quit events. We must now add code to check the event loop for at least some of the above mentioned events. Let's assume our event loop looks like this:

```

SDL_Event event;
/* Other initialization code goes here */

/* Start main game loop here */

while(SDL_PollEvent(&event))
{

```

```

switch(event.type)
{
    case SDL_KEYDOWN:
        /* handle keyboard stuff here */
        break;

    case SDL_QUIT:
        /* Set whatever flags are necessary to */
        /* end the main game loop here */
        break;
}

/* End loop here */

```

To handle Joystick events we merely add cases for them, first we'll add axis handling code. Axis checks can get kinda of tricky because alot of the joystick events received are junk. Joystick axis have a tendency to vary just a little between polling due to the way they are designed. To compensate for this you have to set a threshold for changes and ignore the events that have'nt exceeded the threshold. 10% is usually a good threshold value. This sounds a lot more complicated than it is. Here is the Axis event handler:

#### Example 3-4. Joystick Axis Events

```

case SDL_JOYAXISMOTION: /* Handle Joystick Motion */
if ( ( event.jaxis.value < -3200 ) || (event.jaxis.value > 3200 ) )
{
    /* code goes here */
}
break;

```

Another trick with axis events is that up-down and left-right movement are two different sets of axes. The most important axis is axis 0 (left-right) and axis 1 (up-down). To handle them seperatly in the code we do the following:

#### Example 3-5. More Joystick Axis Events

```

case SDL_JOYAXISMOTION: /* Handle Joystick Motion */
if ( ( event.jaxis.value < -3200 ) || (event.jaxis.value > 3200 ) )
{
    if( event.jaxis.axis == 0)
    {
        /* Left-right movement code goes here */
    }

    if( event.jaxis.axis == 1)
    {
        /* Up-Down movement code goes here */
    }
}

```

```

    }
}
break;

```

Ideally the code here should use *event.jaxis.value* to scale something. For example lets assume you are using the joystick to control the movement of a spaceship. If the user is using an analog joystick and they push the stick a little bit they expect to move less than if they pushed it a lot. Designing your code for this situation is preferred because it makes the experience for users of analog controls better and remains the same for users of digital controls.

If your joystick has any additional axis then they may be used for other sticks or throttle controls and those axis return values too just with different *event.jaxis.axis* values.

Button handling is simple compared to the axis checking.

### Example 3-6. Joystick Button Events

```

case SDL_JOYBUTTONDOWN: /* Handle Joystick Button Presses */
if ( event.jbutton.button == 0 )
{
    /* code goes here */
}
break;

```

Button checks are simpler than axis checks because a button can only be pressed or not pressed. The `SDL_JOYBUTTONDOWN` event is triggered when a button is pressed and the `SDL_JOYBUTTONUP` event is fired when a button is released. We do have to know what button was pressed though, that is done by reading the *event.jbutton.button* field.

Lastly when we are through using our joysticks we should close them with a call to `SDL_JoystickClose`. To close our opened joystick 0 we would do this at the end of our program:

```

SDL_JoystickClose(joystick);

```

## Advanced Joystick Functions

That takes care of the controls that you can count on being on every joystick under the sun, but there are a few extra things that SDL can support. Joyballs are next on our list, they are alot like axis we a few minor differences. Joyballs store relative changes unlike the the absolute postion stored in a axis event. Also one trackball event contains both the change in x and they change in y. Our case for it is as follows:

### Example 3-7. Joystick Ball Events

```

case SDL_JOYBALLMOTION: /* Handle Joyball Motion */

```

```

    if( event.jball.ball == 0 )
    {
        /* ball handling */
    }
    break;

```

The above checks the first joyball on the joystick. The change in position will be stored in *event.jball.xrel* and *event.jball.yrel*.

Finally we have the hat event. Hats report only the direction they are pushed in. We check hat's position with the bitmasks:

```

SDL_HAT_CENTERED
SDL_HAT_UP
SDL_HAT_RIGHT
SDL_HAT_DOWN
SDL_HAT_LEFT

```

Also there are some predefined combinations of the above:

```

SDL_HAT_RIGHTUP
SDL_HAT_RIGHTDOWN
SDL_HAT_LEFTUP
SDL_HAT_LEFTDOWN

```

Our case for the hat may resemble the following:

#### Example 3-8. Joystick Hat Events

```

case SDL_JOYHATMOTION: /* Handle Hat Motion */
if ( event.jhat.hat | SDL_HAT_UP )
{
    /* Do up stuff here */
}

if ( event.jhat.hat | SDL_HAT_LEFT )
{
    /* Do left stuff here */
}

if ( event.jhat.hat | SDL_HAT_RIGHTDOWN )
{
    /* Do right and down together stuff here */
}
break;

```

In addition to the queries for number of joysticks on the system and their names there are additional functions to query the capabilities of attached joysticks:

SDL_JoystickNumAxes	Returns the number of joystick axes
SDL_JoystickNumButtons	Returns the number of joystick buttons
SDL_JoystickNumBalls	Returns the number of joystick balls

`SDL_JoystickNumHats` Returns the number of joystick hats

To use these functions we just have to pass in the joystick structure we got when we opened the joystick. For Example:

#### Example 3-9. Querying Joystick Characteristics

```
int number_of_buttons;
SDL_Joystick *joystick;

joystick = SDL_JoystickOpen(0);
number_of_buttons = SDL_JoystickNumButtons(joystick);
```

This block of code would get the number of buttons on the first joystick in the system.

## Handling the Keyboard

### Keyboard Related Structures

It should make it a lot easier to understand this tutorial if you are familiar with the data types involved in keyboard access, so I'll explain them first.

#### SDLKey

`SDLKey` is an enumerated type defined in `SDL/include/SDL_keysym.h` and detailed here. Each `SDLKey` symbol represents a key, `SDLK_a` corresponds to the 'a' key on a keyboard, `SDLK_SPACE` corresponds to the space bar, and so on.

#### SDLMod

`SDLMod` is an enumerated type, similar to `SDLKey`, however it enumerates keyboard modifiers (Control, Alt, Shift). The full list of modifier symbols is here. `SDLMod` values can be AND'd together to represent several modifiers.

#### SDL\_keysym

```
typedef struct{
    Uint8  scancode;
    SDLKey sym;
    SDLMod mod;
    Uint16 unicode;
} SDL_keysym;
```

The `SDL_keysym` structure describes a key press or a key release. The *scancode* field is hardware specific and should be ignored unless you know what your doing. The *sym* field is the `SDLKey` value of the key being pressed or released. The *mod* field describes the state of the keyboard modifiers at the time the key press or release occurred. So a value of `KMOD_NUM | KMOD_CAPS | KMOD_LSHIFT` would mean that Numlock, Capslock and the left shift key were all press (or enabled in the case of the lock keys). Finally, the *unicode* field stores the 16-bit unicode value of the key.

**Note:** It should be noted and understood that this field is only valid when the `SDL_keysym` is describing a key press, not a key release. Unicode values only make sense on a key press because the unicode value describes an international character and only key presses produce characters. More information on Unicode can be found at [www.unicode.org](http://www.unicode.org) (<http://www.unicode.org>)

**Note:** Unicode translation must be enabled using the `SDL_EnableUNICODE` function.

## SDL\_KeyboardEvent

```
typedef struct{
    Uint8 type;
    Uint8 state;
    SDL_keysym keysym;
} SDL_KeyboardEvent;
```

The `SDL_KeyboardEvent` describes a keyboard event (obviously). The *key* member of the `SDL_Event` union is a `SDL_KeyboardEvent` structure. The *type* field specifies whether the event is a key release (`SDL_KEYUP`) or a key press (`SDL_KEYDOWN`) event. The *state* is largely redundant, it reports the same information as the *type* field but uses different values (`SDL_RELEASED` and `SDL_PRESSED`). The *keysym* contains information of the key press or release that this event represents (see above).

## Reading Keyboard Events

Reading keyboard events from the event queue is quite simple (the event queue and using it is described here). We read events using `SDL_PollEvent` in a `while( )` loop and check for `SDL_KEYUP` and `SDL_KEYDOWN` events using a `switch` statement, like so:

### Example 3-10. Reading Keyboard Events

```
SDL_Event event;
```

```

.
.
/* Poll for events. SDL_PollEvent() returns 0 when there are no */
/* more events on the event queue, our while loop will exit when */
/* that occurs. */
while( SDL_PollEvent( &event ) ){
    /* We are only worried about SDL_KEYDOWN and SDL_KEYUP events */
    switch( event.type ){
        case SDL_KEYDOWN:
            printf( "Key press detected\n" );
            break;

        case SDL_KEYUP:
            printf( "Key release detected\n" );
            break;

        default:
            break;
    }
}
.
.

```

This is a very basic example. No information about the key press or release is interpreted. We will explore the other extreme out our first full example below - reporting all available information about a keyboard event.

## A More Detailed Look

Before we can read events SDL must be initialised with `SDL_Init` and a video mode must be set using `SDL_SetVideoMode`. There are, however, two other functions we must use to obtain all the information required. We must enable unicode translation by calling `SDL_EnableUNICODE(1)` and we must convert `SDLKey` values into something printable, using `SDL_GetKeyName`

**Note:** It is useful to note that unicode values < 0x80 translate directly a characters ASCII value. This is used in the example below

### Example 3-11. Interpreting Key Event Information

```

#include "SDL.h"

/* Function Prototypes */
void PrintKeyInfo( SDL_KeyboardEvent *key );
void PrintModifiers( SDLMod mod );

```

```

/* main */
int main( int argc, char *argv[] ){

    SDL_Event event;
    int quit = 0;

    /* Initialise SDL */
    if( SDL_Init( SDL_INIT_VIDEO ) ){
        fprintf( stderr, "Could not initialise SDL: %s\n", SDL_GetError() );
        exit( -1 );
    }

    /* Set a video mode */
    if( !SDL_SetVideoMode( 320, 200, 0, 0 ) ){
        fprintf( stderr, "Could not set video mode: %s\n", SDL_GetError() );
        SDL_Quit();
        exit( -1 );
    }

    /* Enable Unicode translation */
    SDL_EnableUNICODE( 1 );

    /* Loop until an SDL_QUIT event is found */
    while( !quit ){

        /* Poll for events */
        while( SDL_PollEvent( &event ) ){

            switch( event.type ){
                /* Keyboard event */
                /* Pass the event data onto PrintKeyInfo() */
                case SDL_KEYDOWN:
                case SDL_KEYUP:
                    PrintKeyInfo( &event.key );
                    break;

                /* SDL_QUIT event (window close) */
                case SDL_QUIT:
                    quit = 1;
                    break;

                default:
                    break;
            }
        }
    }
}

```

```

    /* Clean up */
    SDL_Quit();
    exit( 0 );
}

/* Print all information about a key event */
void PrintKeyInfo( SDL_KeyboardEvent *key ){
    /* Is it a release or a press? */
    if( key->type == SDL_KEYUP )
        printf( "Release:- " );
    else
        printf( "Press:- " );

    /* Print the hardware scancode first */
    printf( "Scancode: 0x%02X", key->keysym.scancode );

if( mod & KMOD_RALT ) printf( "RALT " );
if( mod & KMOD_LALT ) printf( "LALT " );
if( mod & KMOD_CTRL ) printf( "CTRL " );
if( mod & KMOD_SHIFT ) printf( "SHIFT " );
if( mod & KMOD_ALT ) printf( "ALT " );
printf( "\n" );
}

```

## Game-type Input

I have found that people using keyboard events for games and other interactive applications don't always understand one fundamental point.

Keyboard events *only* take place when a keys state changes from being unpressed to pressed, and vice versa.

Imagine you have an image of an alien that you wish to move around using the cursor keys - when you pressed the left arrow key you want him to slide over to the left, when you press the down key you want him to slide down the screen. Examine the following code, it highlights and error that many people have made.

```

/* Alien screen coordinates */
int alien_x=0, alien_y=0;
.
.
/* Initialise SDL and video modes and all that */
.
/* Main game loop */
/* Check for events */
while( SDL_PollEvent( &event ) ){
    switch( event.type ){
        /* Look for a keypress */
        case SDL_KEYDOWN:
            /* Check the SDLKey values and move change the coords */
            switch( event.key.keysym.sym ){
                case SDLK_LEFT:
                    alien_x -= 1;

```

```

        break;
    case SDLK_RIGHT:
        alien_x += 1;
        break;
    case SDLK_UP:
        alien_y -= 1;
        break;
    case SDLK_DOWN:
        alien_y += 1;
        break;
    default:
        break;
    }
}
}
.
.

```

At first glance you may think this is a perfectly reasonable piece of code for the task, but it isn't. Like I said keyboard events only occur when a key changes state, so the user would have to press and release the left cursor key 100 times to move the alien 100 pixels to the left.

To get around this problem we must not use the events to change the position of the alien, we use the events to set flags which are then used in a separate section of code to move the alien. Something like this:

### Example 3-12. Proper Game Movement

```

/* Alien screen coordinates */
int alien_x=0, alien_y=0;
int alien_xvel=0, alien_yvel=0;
.
.
/* Initialise SDL and video modes and all that */
.
/* Main game loop */
/* Check for events */
while( SDL_PollEvent( &event ) ){
    switch( event.type ){
        /* Look for a keypress */
        case SDL_KEYDOWN:
            /* Check the SDLKey values and move change the coords */
            switch( event.key.keysym.sym ){
                case SDLK_LEFT:
                    alien_xvel = -1;
                    break;
                case SDLK_RIGHT:
                    alien_xvel = 1;

```

```

        break;
    case SDLK_UP:
        alien_yvel = -1;
        break;
    case SDLK_DOWN:
        alien_yvel = 1;
        break;
    default:
        break;
}
break;
/* We must also use the SDL_KEYUP events to zero the x */
/* and y velocity variables. But we must also be */
/* careful not to zero the velocities when we shouldn't */
case SDL_KEYUP:
    switch( event.key.keysym.sym ){
        case SDLK_LEFT:
            /* We check to make sure the alien is moving */
            /* to the left. If it is then we zero the */
            /* velocity. If the alien is moving to the */
            /* right then the right key is still press */
            /* so we don't touch the velocity */
            if( alien_xvel < 0 )
                alien_xvel = 0;
            break;
        case SDLK_RIGHT:
            if( alien_xvel > 0 )
                alien_xvel = 0;
            break;
        case SDLK_UP:
            if( alien_yvel < 0 )
                alien_yvel = 0;
            break;
        case SDLK_DOWN:
            if( alien_yvel > 0 )
                alien_yvel = 0;
            break;
        default:
            break;
    }
    break;

default:
    break;
}

}
.
.
/* Update the alien position */

```

```
alien_x += alien_xvel;  
alien_y += alien_yvel;
```

As can be seen, we use two extra variables, `alien_xvel` and `alien_yvel`, which represent the motion of the ship, it is these variables that we update when we detect keypresses and releases.

# Chapter 4. Examples

## Introduction

For the moment these examples are taken directly from the old SDL documentation. By the 1.2 release these examples should hopefully deal with most common SDL programming problems.

## Event Examples

### Filtering and Handling Events

```
#include <stdio.h>
#include <stdlib.h>

#include "SDL.h"

/* This function may run in a separate event thread */
int FilterEvents(const SDL_Event *event) {
    static int boycott = 1;

    /* This quit event signals the closing of the window */
    if ( (event->type == SDL_QUIT) && boycott ) {
        printf("Quit event filtered out -- try again.\n");
        boycott = 0;
        return(0);
    }
    if ( event->type == SDL_MOUSEMOTION ) {
        printf("Mouse moved to (%d,%d)\n",
            event->motion.x, event->motion.y);
        return(0);    /* Drop it, we've handled it */
    }
    return(1);
}

int main(int argc, char *argv[])
{
    SDL_Event event;

    /* Initialize the SDL library (starts the event loop) */
    if ( SDL_Init(SDL_INIT_VIDEO) < 0 ) {
        fprintf(stderr,
```

```

        "Couldn't initialize SDL: %s\n", SDL_GetError());
    exit(1);
}

/* Clean up on exit, exit on window close and interrupt */
atexit(SDL_Quit);

/* Ignore key events */
SDL_EventState(SDL_KEYDOWN, SDL_IGNORE);
SDL_EventState(SDL_KEYUP, SDL_IGNORE);

/* Filter quit and mouse motion events */
SDL_SetEventFilter(FilterEvents);

/* The mouse isn't much use unless we have a display for reference */
if ( SDL_SetVideoMode(640, 480, 8, 0) == NULL ) {
    fprintf(stderr, "Couldn't set 640x480x8 video mode: %s\n",
        SDL_GetError());
    exit(1);
}

/* Loop waiting for ESC+Mouse_Button */
while ( SDL_WaitEvent(&event) >= 0 ) {
    switch (event.type) {
        case SDL_ACTIVEEVENT: {
            if ( event.active.state & SDL_APPACTIVE ) {
                if ( event.active.gain ) {
                    printf("App activated\n");
                } else {
                    printf("App iconified\n");
                }
            }
        }
        break;

        case SDL_MOUSEBUTTONDOWN: {
            Uint8 *keys;

            keys = SDL_GetKeyState(NULL);
            if ( keys[SDLK_ESCAPE] == SDL_PRESSED ) {
                printf("Bye bye...\n");
                exit(0);
            }
            printf("Mouse button pressed\n");
        }
        break;

        case SDL_QUIT: {
            printf("Quit requested, quitting.\n");

```

```

        exit(0);
    }
    break;
}
}
/* This should never happen */
printf("SDL_WaitEvent error: %s\n", SDL_GetError());
exit(1);
}

```

## Audio Examples

### Opening the audio device

```

SDL_AudioSpec wanted;
extern void fill_audio(void *udata, Uint8 *stream, int len);

/* Set the audio format */
wanted.freq = 22050;
wanted.format = AUDIO_S16;
wanted.channels = 2; /* 1 = mono, 2 = stereo */
wanted.samples = 1024; /* Good low-latency value for callback */
wanted.callback = fill_audio;
wanted.userdata = NULL;

/* Open the audio device, forcing the desired format */
if ( SDL_OpenAudio(&wanted, NULL) < 0 ) {
    fprintf(stderr, "Couldn't open audio: %s\n", SDL_GetError());
    return(-1);
}
return(0);

```

### Playing audio

```

static Uint8 *audio_chunk;
static Uint32 audio_len;
static Uint8 *audio_pos;

```

```

/* The audio function callback takes the following parameters:
   stream: A pointer to the audio buffer to be filled
   len:    The length (in bytes) of the audio buffer
*/
void fill_audio(void *udata, Uint8 *stream, int len)
{
    /* Only play if we have data left */
    if ( audio_len == 0 )
        return;

    /* Mix as much data as possible */
    len = ( len > audio_len ? audio_len : len );
    SDL_MixAudio(stream, audio_pos, len, SDL_MIX_MAXVOLUME)
    audio_pos += len;
    audio_len -= len;
}

/* Load the audio data ... */

;;;;;

audio_pos = audio_chunk;

/* Let the callback function play the audio chunk */
SDL_PauseAudio(0);

/* Do some processing */

;;;;;

/* Wait for sound to complete */
while ( audio_len > 0 ) {
    SDL_Delay(100);          /* Sleep 1/10 second */
}
SDL_CloseAudio();

```

## CDROM Examples

## Listing CD-ROM drives

```
#include "SDL.h"

/* Initialize SDL first */
if ( SDL_Init(SDL_INIT_CDROM) < 0 ) {
    fprintf(stderr, "Couldn't initialize SDL: %s\n",SDL_GetError());
    exit(1);
}
atexit(SDL_Quit);

/* Find out how many CD-ROM drives are connected to the system */
printf("Drives available: %d\n", SDL_CDNumDrives());
for ( i=0; i<SDL_CDNumDrives(); ++i ) {
    printf("Drive %d:  \"%s\"\n", i, SDL_CDName(i));
}
```

## Opening the default drive

```
SDL_CD *cdrom;
CDstatus status;
char *status_str;

cdrom = SDL_CDOpen(0);
if ( cdrom == NULL ) {
    fprintf(stderr, "Couldn't open default CD-ROM drive: %s\n",
              SDL_GetError());
    exit(2);
}

status = SDL_CDStatus(cdrom);
switch (status) {
    case CD_TRAYEMPTY:
        status_str = "tray empty";
        break;
    case CD_STOPPED:
        status_str = "stopped";
        break;
    case CD_PLAYING:
        status_str = "playing";
        break;
    case CD_PAUSED:
        status_str = "paused";
        break;
}
```

```

        case CD_ERROR:
            status_str = "error state";
            break;
    }
    printf("Drive status: %s\n", status_str);
    if ( status >= CD_PLAYING ) {
        int m, s, f;
        FRAMES_TO_MSf(cdrom->cur_frame, &m, &s, &f);
        printf("Currently playing track %d, %d:%2.2d\n",
            cdrom->track[cdrom->cur_track].id, m, s);
    }
}

```

## Listing the tracks on a CD

```

SDL_CD *cdrom;          /* Assuming this has already been set.. */
int i;
int m, s, f;

SDL_CDStatus(cdrom);
printf("Drive tracks: %d\n", cdrom->numtracks);
for ( i=0; i<cdrom->numtracks; ++i ) {
    FRAMES_TO_MSf(cdrom->track[i].length, &m, &s, &f);
    if ( f > 0 )
        ++s;
    printf("\tTrack (index %d) %d: %d:%2.2d\n", i,
        cdrom->track[i].id, m, s);
}

```

## Play an entire CD

```

SDL_CD *cdrom;          /* Assuming this has already been set.. */

// Play entire CD:
if ( CD_INDRIVE(SDL_CDStatus(cdrom)) )
    SDL_CDPlayTracks(cdrom, 0, 0, 0, 0);

// Play last track:
if ( CD_INDRIVE(SDL_CDStatus(cdrom)) ) {
    SDL_CDPlayTracks(cdrom, cdrom->numtracks-1, 0, 0, 0);
}

```

```
// Play first and second track and 10 seconds of third track:
if ( CD_INDRIVE(SDL_CDStatus(cdrom)) )
    SDL_CDPlayTracks(cdrom, 0, 0, 2, 10);
```

## Time Examples

### Time based game loop

```
#define TICK_INTERVAL    30

Uint32 TimeLeft(void)
{
    static Uint32 next_time = 0;
    Uint32 now;

    now = SDL_GetTicks();
    if ( next_time <= now ) {
        next_time = now+TICK_INTERVAL;
        return(0);
    }
    return(next_time-now);
}

/* main game loop

while ( game_running ) {
    UpdateGameState();
    SDL_Delay(TimeLeft());
}
```

## **II. SDL Reference**

## Chapter 5. General

Before SDL can be used in a program it must be initialized with `SDL_Init`. `SDL_Init` initializes all the subsystems that the user requests (video, audio, joystick, timers and/or cdrom). Once SDL is initialized with `SDL_Init` subsystems can be shut down and initialized as needed using `SDL_InitSubSystem` and `SDL_QuitSubSystem`.

SDL must also be shut down before the program exits to make sure it cleans up correctly. Calling `SDL_Quit` shuts down all subsystems and frees any resources allocated to SDL.

### SDL\_Init

#### Name

`SDL_Init` — Initializes SDL

#### Synopsis

```
#include "SDL.h"
int SDL_Init(Uint32 flags);
```

#### Description

Initializes SDL. This should be called before all other SDL functions. The *flags* parameter specifies what part(s) of SDL to initialize.

<code>SDL_INIT_TIMER</code>	Initializes the timer subsystem.
<code>SDL_INIT_AUDIO</code>	Initializes the audio subsystem.
<code>SDL_INIT_VIDEO</code>	Initializes the video subsystem.
<code>SDL_INIT_CDROM</code>	Initializes the cdrom subsystem.
<code>SDL_INIT_JOYSTICK</code>	Initializes the joystick subsystem.
<code>SDL_INIT EVERYTHING</code>	Initialize all of the above.
<code>SDL_INIT_NOPARACHUTE</code>	Prevents SDL from catching fatal signals.
<code>SDL_INIT_EVENTTHREAD</code>	

## **Return Value**

Returns -1 on an error or 0 on success.

## **See Also**

SDL\_Quit, SDL\_InitSubSystem

# SDL\_InitSubSystem

## Name

SDL\_InitSubSystem — Initialize subsystems

## Synopsis

```
#include "SDL.h"
int SDL_InitSubSystem(Uint32 flags);
```

## Description

After SDL has been initialized with `SDL_Init` you may initialize uninitialized subsystems with `SDL_InitSubSystem`. The *flags* parameter is the same as that used in `SDL_Init`.

## Examples

```
/* Separating Joystick and Video initialization. */
SDL_Init(SDL_INIT_VIDEO);
.
.
SDL_SetVideoMode(640, 480, 16, SDL_DOUBLEBUF|SDL_FULLSCREEN);
.
/* Do Some Video stuff */
.
.
/* Initialize the joystick subsystem */
SDL_InitSubSystem(SDL_INIT_JOYSTICK);

/* Do some stuff with video and joystick */
.
.
.
/* Shut them both down */
SDL_Quit();
```

## **Return Value**

Returns -1 on an error or 0 on success.

## **See Also**

SDL\_Init, SDL\_Quit, SDL\_QuitSubSystem

# SDL\_QuitSubSystem

## Name

SDL\_QuitSubSystem — Shut down a subsystem

## Synopsis

```
#include "SDL.h"
void SDL_QuitSubSystem(Uint32 flags);
```

## Description

SDL\_QuitSubSystem allows you to shut down a subsystem that has been previously initialized by SDL\_Init or SDL\_InitSubSystem. The *flags* tells SDL\_QuitSubSystem which subsystems to shut down, it uses the same values that are passed to SDL\_Init.

## See Also

SDL\_Quit, SDL\_Init, SDL\_InitSubSystem

# SDL\_Quit

## Name

SDL\_Quit — Shut down SDL

## Synopsis

```
#include "SDL.h"
void SDL_Quit(void);
```

## Description

SDL\_Quit shuts down all SDL subsystems and frees the resources allocated to them. This should always be called before you exit. For the sake of simplicity you can set SDL\_Quit as your atexit call, like:

```
SDL_Init(SDL_INIT_VIDEO|SDL_INIT_AUDIO);
atexit(SDL_Quit);
.
```

**Note:** While using atexit maybe be fine for small programs, more advanced users should shut down SDL in their own cleanup code. Plus, using atexit in a library is a sure way to crash dynamically loaded code

## See Also

SDL\_QuitSubsystem, SDL\_Init

# SDL\_WasInit

## Name

SDL\_WasInit — Check which subsystems are initialized

## Synopsis

```
#include "SDL.h"
Uint32 SDL_WasInit(Uint32 flags);
```

## Description

SDL\_WasInit allows you to see which SDL subsystems have been initialized. *flags* is a bitwise OR'd combination of the subsystems you wish to check (see SDL\_Init for a list of subsystem flags).

## Return Value

SDL\_WasInit returns a bitwised OR'd combination of the initialized subsystems.

## Examples

```
/* Here are several ways you can use SDL_WasInit() */

/* Get init data on all the subsystems */
Uint32 subsystem_init;

subsystem_init=SDL_WasInit(SDL_INIT_EVERYTHING);

if(subsystem_init&SDL_INIT_VIDEO)
    printf("Video is initialized.\n");
else
    printf("Video is not initialized.\n");

/* Just check for one specific subsystem */

if(SDL_WasInit(SDL_INIT_VIDEO)!=0)
```

```
    printf("Video is initialized.\n");
else
    printf("Video is not initialized.\n");

/* Check for two subsystems */

Uint32 subsystem_mask=SDL_INIT_VIDEO|SDL_INIT_AUDIO;

if(SDL_WasInit(subsystem_mask)==subsystem_mask)
    printf("Video and Audio initialized.\n");
else
    printf("Video and Audio not initialized.\n");
```

## Chapter 6. Video

SDL presents a very simple interface to the display framebuffer. The framebuffer is represented as an offscreen surface to which you can write directly. If you want the screen to show what you have written, call the update function which will guarantee that the desired portion of the screen is updated.

Before you call any of the SDL video functions, you must first call `SDL_Init(SDL_INIT_VIDEO)`, which initializes the video and events in the SDL library. Check the return code, which should be 0, to see if there were any errors in starting up.

If you use both sound and video in your application, you need to call `SDL_Init(SDL_INIT_AUDIO | SDL_INIT_VIDEO)` before opening the sound device, otherwise under Win32 DirectX, you won't be able to set full-screen display modes.

After you have initialized the library, you can start up the video display in a number of ways. The easiest way is to pick a common screen resolution and depth and just initialize the video, checking for errors. You will probably get what you want, but SDL may be emulating your requested mode and converting the display on update. The best way is to query, for the best video mode closest to the desired one, and then convert your images to that pixel format.

SDL currently supports any bit depth  $\geq 8$  bits per pixel. 8 bpp formats are considered 8-bit palettized modes, while 12, 15, 16, 24, and 32 bits per pixel are considered "packed pixel" modes, meaning each pixel contains the RGB color components packed in the bits of the pixel.

After you have initialized your video mode, you can take the surface that was returned, and write to it like any other framebuffer, calling the update routine as you go.

When you have finished your video access and are ready to quit your application, you should call `"SDL_Quit()"` to shutdown the video and events.

## SDL\_GetVideoSurface

### Name

`SDL_GetVideoSurface` — returns a pointer to the current display surface

### Synopsis

```
#include "SDL.h"
SDL_Surface *SDL_GetVideoSurface(void);
```

## **Description**

This function returns a pointer to the current display surface. If SDL is doing format conversion on the display surface, this function returns the publicly visible surface, not the real video surface.

## **See Also**

`SDL_Surface`

# SDL\_GetVideoInfo

## Name

SDL\_GetVideoInfo — returns a pointer to information about the video hardware

## Synopsis

```
#include "SDL.h"
SDL_VideoInfo *SDL_GetVideoInfo(void);
```

## Description

This function returns a read-only pointer to information about the video hardware. If this is called before `SDL_SetVideoMode`, the *vfmt* member of the returned structure will contain the pixel format of the "best" video mode.

## See Also

SDL\_SetVideoMode, SDL\_VideoInfo

# SDL\_VideoDriverName

## Name

SDL\_VideoDriverName — Obtain the name of the video driver

## Synopsis

```
#include "SDL.h"
char *SDL_VideoDriverName(char *namebuf, int maxlen);
```

## Description

The buffer pointed to by *namebuf* is filled up to a maximum of *maxlen* characters (include the NULL terminator) with the name of the initialised video driver. The driver name is a simple one word identifier like "x11" or "windib".

## Return Value

Returns NULL if video has not been initialised with `SDL_Init` or a pointer to *namebuf* otherwise.

## See Also

SDL\_Init SDL\_InitSubSystem

# SDL\_ListModes

## Name

`SDL_ListModes` — Returns a pointer to an array of available screen dimensions for the given format and video flags

## Synopsis

```
#include "SDL.h"
SDL_Rect **SDL_ListModes(SDL_PixelFormat *format, Uint32 flags);
```

## Description

Return a pointer to an array of available screen dimensions for the given format and video flags, sorted largest to smallest. Returns NULL if there are no dimensions available for a particular format, or -1 if any dimension is okay for the given format.

If *format* is NULL, the mode list will be for the format returned by `SDL_GetVideoInfo()->vfmt`. The *flag* parameter is an OR'd combination of surface flags. The flags are the same as those used `SDL_SetVideoMode` and they play a strong role in deciding what modes are valid. For instance, if you pass `SDL_HWSURFACE` as a flag only modes that support hardware video surfaces will be returned.

## Example

```
SDL_Rect **modes;
int i;
.
.
.

/* Get available fullscreen/hardware modes */
modes=SDL_ListModes(NULL, SDL_FULLSCREEN|SDL_HWSURFACE);

/* Check is there are any modes available */
if(modes == (SDL_Rect **)0){
    printf("No modes available!\n");
    exit(-1);
}
```

```
/* Check if or resolution is restricted */
if(modes == (SDL_Rect **)-1){
    printf("All resolutions available.\n");
}
else{
    /* Print valid modes */
    printf("Available Modes\n");
    for(i=0;modes[i];++i)
        printf("  %d x %d\n", modes[i]->w, modes[i]->h);
}
.
.
```

## See Also

SDL\_SetVideoMode, SDL\_GetVideoInfo, SDL\_Rect, SDL\_PixelFormat

# SDL\_VideoModeOK

## Name

SDL\_VideoModeOK — Check to see if a particular video mode is supported.

## Synopsis

```
#include "SDL.h"
int SDL_VideoModeOK(int width, int height, int bpp, Uint32 flags);
```

## Description

SDL\_VideoModeOK returns 0 if the requested mode is not supported under any bit depth, or returns the bits-per-pixel of the closest available mode with the given width, height and requested surface flags (see SDL\_SetVideoMode).

The bits-per-pixel value returned is only a suggested mode. You can usually request and bpp you want when setting the video mode and SDL will emulate that color depth with a shadow video surface.

The arguments to SDL\_VideoModeOK are the same ones you would pass to SDL\_SetVideoMode

## Example

```
SDL_Surface *screen;
Uint32 bpp;
.
.
.
printf("Checking mode 640x480@16bpp.\n");
bpp=SDL_VideoModeOK(640, 480, 16, SDL_HWSURFACE);

if(!bpp){
    printf("Mode not available.\n");
    exit(-1);
}

printf("SDL Recommends 640x480@%dbpp.\n", bpp);
screen=SDL_SetVideoMode(640, 480, bpp, SDL_HWSURFACE);
.
```

*SDL\_VideoModeOK*

.

## **See Also**

`SDL_SetVideoMode`, `SDL_GetVideoInfo`

# SDL\_SetVideoMode

## Name

SDL\_SetVideoMode — Set up a video mode with the specified width, height and bits-per-pixel.

## Synopsis

```
#include "SDL.h"
SDL_Surface *SDL_SetVideoMode(int width, int height, int bpp, Uint32
flags);
```

## Description

Set up a video mode with the specified width, height and bits-per-pixel.

If *bpp* is 0, it is treated as the current display bits per pixel.

The *flags* parameter is the same as the *flags* field of the SDL\_Surface structure. OR'd combinations of the following values are valid.

SDL_SWSURFACE	Create the video surface in system memory
SDL_HWSURFACE	Create the video surface in video memory
SDL_ASYNCBLIT	Enables the use of asynchronous to the display surface. This will usually slow down blitting on single CPU machines, but may provide a speed increase on SMP systems.
SDL_ANYFORMAT	Normally, if a video surface of the requested depth ( <i>bpp</i> ) is not available, SDL will emulate one with a shadow surface. Passing SDL_ANYFORMAT prevents this and causes SDL to use the video surface, regardless of its depth.
SDL_HWPALETTE	Give SDL exclusive palette access. Without this flag you may not always get the the colors you request with SDL_SetColors.

SDL_DOUBLEBUF	Enable double buffering; only valid with SDL_HWSURFACE. Calling SDL_Flip will flip the buffers and update the screen. If double buffering could not be enabled then SDL_Flip will just perform a SDL_UpdateRect on the entire screen.
SDL_FULLSCREEN	SDL will attempt to use a fullscreen mode
SDL_OPENGL	Create an OpenGL rendering context. You should have previously set OpenGL video attributes with SDL_GL_SetAttribute.
SDL_OPENGLBLIT	Create an OpenGL rendering context, like above, but allow normal blitting operations.
SDL_RESIZABLE	Create a resizable window. When the window is resized by the user a SDL_VIDEORESIZE event is generated and SDL_SetVideoMode can be called again with the new size.
SDL_NOFRAME	If possible, SDL_NOFRAME causes SDL to create a window with no title bar or frame decoration. Fullscreen modes automatically have this flag set.

**Note:** Whatever *flags* SDL\_SetVideoMode could satisfy are set in the *flags* member of the returned surface.

## Return Value

The framebuffer surface, or NULL if it fails.

## See Also

SDL\_LockSurface, SDL\_SetColors, SDL\_Flip, SDL\_Surface

# SDL\_UpdateRect

## Name

SDL\_UpdateRect — Makes sure the given area is updated on the given screen.

## Synopsis

```
#include "SDL.h"
void SDL_UpdateRect(SDL_Surface *screen, Sint32 x, Sint32 y, Sint32 w,
Sint32 h);
```

## Description

Makes sure the given area is updated on the given screen.

If 'x', 'y', 'w' and 'h' are all 0, SDL\_UpdateRect will update the entire screen.

This function should not be called while '*screen*' is locked.

## See Also

SDL\_UpdateRects, SDL\_Rect, SDL\_Surface, SDL\_LockSurface

# SDL\_UpdateRects

## Name

SDL\_UpdateRects — Makes sure the given list of rectangles is updated on the given screen.

## Synopsis

```
#include "SDL.h"
void SDL_UpdateRects(SDL_Surface *screen, int numrects, SDL_Rect *rects);
```

## Description

Makes sure the given list of rectangles is updated on the given screen.

This function should not be called while *screen* is locked.

**Note:** It is advised to call this function only once per frame, since each call has some processing overhead. This is no restriction since you can pass any number of rectangles each time.

The rectangles are not automatically merged or checked for overlap. In general, the programmer can use his knowledge about his particular rectangles to merge them in an efficient way, to avoid overdraw.

## See Also

SDL\_UpdateRect, SDL\_Rect, SDL\_Surface, SDL\_LockSurface

# SDL\_Flip

## Name

SDL\_Flip — Swaps screen buffers

## Synopsis

```
#include "SDL.h"
int SDL_Flip(SDL_Surface *screen);
```

## Description

On hardware that supports double-buffering, this function sets up a flip and returns. The hardware will wait for vertical retrace, and then swap video buffers before the next video surface blit or lock will return. On hardware that doesn't support double-buffering, this is equivalent to calling `SDL_UpdateRect(screen, 0, 0, 0, 0)`

The `SDL_DOUBLEBUF` flag must have been passed to `SDL_SetVideoMode`, when setting the video mode for this function to perform hardware flipping.

## Return Value

This function returns 0 if successful, or -1 if there was an error.

`SDL_SetVideoMode`, `SDL_UpdateRect`, `SDL_Surface`

# SDL\_SetColors

## Name

SDL\_SetColors — Sets a portion of the colormap for the given 8-bit surface.

## Synopsis

```
#include "SDL.h"
int SDL_SetColors(SDL_Surface *surface, SDL_Color *colors, int firstcolor,
int ncolors);
```

## Description

Sets a portion of the colormap for the given 8-bit surface.

When *surface* is the surface associated with the current display, the display colormap will be updated with the requested colors. If SDL\_HWPALETTE was set in SDL\_SetVideoMode flags, SDL\_SetColors will always return 1, and the palette is guaranteed to be set the way you desire, even if the window colormap has to be warped or run under emulation.

The color components of a SDL\_Color structure are 8-bits in size, giving you a total of  $256^3 = 16777216$  colors.

Palettized (8-bit) screen surfaces with the SDL\_HWPALETTE flag have two palettes, a logical palette that is used for mapping blits to/from the surface and a physical palette (that determines how the hardware will map the colors to the display). SDL\_SetColors modifies both palettes (if present), and is equivalent to calling SDL\_SetPalette with the *flags* set to (SDL\_LOGPAL | SDL\_PHYSPAL).

## Return Value

If *surface* is not a palettized surface, this function does nothing, returning 0. If all of the colors were set as passed to SDL\_SetColors, it will return 1. If not all the color entries were set exactly as given, it will return 0, and you should look at the surface palette to determine the actual color palette.

## Example

```
/* Create a display surface with a grayscale palette */
```

```

SDL_Surface *screen;
SDL_Color colors[256];
int i;
.
.
.
/* Fill colors with color information */
for(i=0;i<256;i++){
    colors[i].r=i;
    colors[i].g=i;
    colors[i].b=i;
}

/* Create display */
screen=SDL_SetVideoMode(640, 480, 8, SDL_HWPALETTE);
if(!screen){
    printf("Couldn't set video mode: %s\n", SDL_GetError());
    exit(-1);
}

/* Set palette */
SDL_SetColors(screen, colors, 0, 256);
.
.
.
.

```

## See Also

SDL\_Color SDL\_Surface, SDL\_SetPalette, SDL\_SetVideoMode

# SDL\_SetPalette

## Name

`SDL_SetPalette` — Sets the colors in the palette of an 8-bit surface.

## Synopsis

```
#include "SDL.h"
int SDL_SetPalette(SDL_Surface *surface, int flags, SDL_Color *colors, int
firstcolor, int ncolors);
```

## Description

Sets a portion of the palette for the given 8-bit surface.

Palettized (8-bit) screen surfaces with the `SDL_HWPALLETTE` flag have two palettes, a logical palette that is used for mapping blits to/from the surface and a physical palette (that determines how the hardware will map the colors to the display). `SDL_BlitSurface` always uses the logical palette when blitting surfaces (if it has to convert between surface pixel formats). Because of this, it is often useful to modify only one or the other palette to achieve various special color effects (e.g., screen fading, color flashes, screen dimming).

This function can modify either the logical or physical palette by specifying `SDL_LOGPAL` or `SDL_PHYSPAL` in the *flags* parameter.

When *surface* is the surface associated with the current display, the display colormap will be updated with the requested colors. If `SDL_HWPALLETTE` was set in `SDL_SetVideoMode` flags, `SDL_SetPalette` will always return 1, and the palette is guaranteed to be set the way you desire, even if the window colormap has to be warped or run under emulation.

The color components of a `SDL_Color` structure are 8-bits in size, giving you a total of  $256^3=16777216$  colors.

## Return Value

If *surface* is not a palettized surface, this function does nothing, returning 0. If all of the colors were set as passed to `SDL_SetPalette`, it will return 1. If not all the color entries were set exactly as given, it will return 0, and you should look at the surface palette to determine the actual color palette.

## Example

```

/* Create a display surface with a grayscale palette */
SDL_Surface *screen;
SDL_Color colors[256];
int i;
.
.
.
/* Fill colors with color information */
for(i=0;i<256;i++){
    colors[i].r=i;
    colors[i].g=i;
    colors[i].b=i;
}

/* Create display */
screen=SDL_SetVideoMode(640, 480, 8, SDL_HWPALETTE);
if(!screen){
    printf("Couldn't set video mode: %s\n", SDL_GetError());
    exit(-1);
}

/* Set palette */
SDL_SetPalette(screen, SDL_LOGPAL|SDL_PHYSPAL, colors, 0, 256);
.
.
.
.

```

## See Also

# SDL\_SetGamma

## Name

SDL\_SetGamma — Sets the color gamma function for the display

## Synopsis

```
#include "SDL.h"
int SDL_SetGamma(float redgamma, float greengamma, float bluegamma);
```

## Description

Sets the "gamma function" for the display of each color component. Gamma controls the brightness/contrast of colors displayed on the screen. A gamma value of 1.0 is identity (i.e., no adjustment is made).

This function adjusts the gamma based on the "gamma function" parameter, you can directly specify lookup tables for gamma adjustment with `SDL_SetGammaRamp`.

Not all display hardware is able to change gamma.

## Return Value

Returns -1 on error (or if gamma adjustment is not supported).

## See Also

`SDL_GetGammaRamp` `SDL_SetGammaRamp`

# SDL\_GetGammaRamp

## Name

SDL\_GetGammaRamp — Gets the color gamma lookup tables for the display

## Synopsis

```
#include "SDL.h"
int SDL_GetGammaRamp(Uint16 *redtable, Uint16 *greentable, Uint16
*bluetable);
```

## Description

Gets the gamma translation lookup tables currently used by the display. Each table is an array of 256 Uint16 values.

Not all display hardware is able to change gamma.

## Return Value

Returns -1 on error.

## See Also

SDL\_SetGamma SDL\_SetGammaRamp

# SDL\_SetGammaRamp

## Name

SDL\_SetGammaRamp — Sets the color gamma lookup tables for the display

## Synopsis

```
#include "SDL.h"
int SDL_SetGammaRamp(Uint16 *redtable, Uint16 *greentable, Uint16
*bluetable);
```

## Description

Sets the gamma lookup tables for the display for each color component. Each table is an array of 256 Uint16 values, representing a mapping between the input and output for that channel. The input is the index into the array, and the output is the 16-bit gamma value at that index, scaled to the output color precision. You may pass NULL to any of the channels to leave them unchanged.

This function adjusts the gamma based on lookup tables, you can also have the gamma calculated based on a "gamma function" parameter with `SDL_SetGamma`.

Not all display hardware is able to change gamma.

## Return Value

Returns -1 on error (or if gamma adjustment is not supported).

## See Also

`SDL_SetGamma` `SDL_GetGammaRamp`

# SDL\_MapRGB

## Name

SDL\_MapRGB — Map a RGB color value to a pixel format.

## Synopsis

```
#include "SDL.h"
Uint32 SDL_MapRGB(SDL_PixelFormat *fmt, Uint8 r, Uint8 g, Uint8 b);
```

## Description

Maps the RGB color value to the specified pixel format and returns the pixel value as a 32-bit int.

If the format has a palette (8-bit) the index of the closest matching color in the palette will be returned.

If the specified pixel format has an alpha component it will be returned as all 1 bits (fully opaque).

## Return Value

A pixel value best approximating the given RGB color value for a given pixel format. If the pixel format bpp (color depth) is less than 32-bpp then the unused upper bits of the return value can safely be ignored (e.g., with a 16-bpp format the return value can be assigned to a Uint16, and similarly a Uint8 for an 8-bpp format).

## See Also

SDL\_GetRGB, SDL\_GetRGBA, SDL\_MapRGBA, SDL\_PixelFormat

# SDL\_MapRGBA

## Name

SDL\_MapRGBA — Map a RGBA color value to a pixel format.

## Synopsis

```
#include "SDL.h"
Uint32 SDL_MapRGBA(SDL_PixelFormat *fmt, Uint8 r, Uint8 g, Uint8 b, Uint8
a);
```

## Description

Maps the RGBA color value to the specified pixel format and returns the pixel value as a 32-bit int.

If the format has a palette (8-bit) the index of the closest matching color in the palette will be returned.

If the specified pixel format has no alpha component the alpha value will be ignored (as it will be in formats with a palette).

## Return Value

A pixel value best approximating the given RGBA color value for a given pixel format. If the pixel format bpp (color depth) is less than 32-bpp then the unused upper bits of the return value can safely be ignored (e.g., with a 16-bpp format the return value can be assigned to a Uint16, and similarly a Uint8 for an 8-bpp format).

## See Also

SDL\_GetRGB, SDL\_GetRGBA, SDL\_MapRGB, SDL\_PixelFormat

# SDL\_GetRGB

## Name

SDL\_GetRGB — Get RGB values from a pixel in the specified pixel format.

## Synopsis

```
#include "SDL.h"
void SDL_GetRGB(Uint32 pixel, SDL_PixelFormat *fmt, Uint8 *r, Uint8 *g,
Uint8 *b);
```

## Description

Get RGB component values from a pixel stored in the specified pixel format.

This function uses the entire 8-bit [0..255] range when converting color components from pixel formats with less than 8-bits per RGB component (e.g., a completely white pixel in 16-bit RGB565 format would return [0xff, 0xff, 0xff] not [0xf8, 0xfc, 0xf8]).

## See Also

SDL\_GetRGBA, SDL\_MapRGB, SDL\_MapRGBA, SDL\_PixelFormat

# SDL\_GetRGBA

## Name

SDL\_GetRGBA — Get RGBA values from a pixel in the specified pixel format.

## Synopsis

```
#include "SDL.h"
void SDL_GetRGBA(Uint32 pixel, SDL_PixelFormat *fmt, Uint8 *r, Uint8 *g,
  Uint8 *b, Uint8 *a);
```

## Description

Get RGBA component values from a pixel stored in the specified pixel format.

This function uses the entire 8-bit [0..255] range when converting color components from pixel formats with less than 8-bits per RGB component (e.g., a completely white pixel in 16-bit RGB565 format would return [0xff, 0xff, 0xff] not [0xf8, 0xfc, 0xf8]).

If the surface has no alpha component, the alpha will be returned as 0xff (100% opaque).

## See Also

SDL\_GetRGB, SDL\_MapRGB, SDL\_MapRGBA, SDL\_PixelFormat

# SDL\_CreateRGBSurface

## Name

SDL\_CreateRGBSurface — Create an empty SDL\_Surface

## Synopsis

```
#include "SDL.h"
SDL_Surface *SDL_CreateRGBSurface(Uint32 flags, int width, int height, int
depth, Uint32 Rmask, Uint32 Gmask, Uint32 Bmask, Uint32 Amask);
```

## Description

Allocate an empty surface (must be called after SDL\_SetVideoMode)

If *depth* is 8 bits an empty palette is allocated for the surface, otherwise a 'packed-pixel' SDL\_PixelFormat is created using the *[RGBA]mask*'s provided (see SDL\_PixelFormat). The *flags* specifies the type of surface that should be created, it is an OR'd combination of the following possible values.

SDL_SWSURFACE	SDL will create the surface in system memory. This improves the performance of pixel level access, however you may not be able to take advantage of some types of hardware blitting.
SDL_HWSURFACE	SDL will attempt to create the surface in video memory. This will allow SDL to take advantage of Video->Video blits (which are often accelerated).
SDL_SRCCOLORKEY	With this flag SDL will attempt to find the best location for this surface, either in system memory or video memory, to obtain hardware colorkey blitting support.
SDL_SRCALPHA	With this flag SDL will attempt to find the best location for this surface, either in system memory or video memory, to obtain hardware alpha support

## See Also

SDL\_CreateRGBSurfaceFrom, SDL\_FreeSurface, SDL\_SetVideoMode, SDL\_LockSurface, SDL\_PixelFormat, SDL\_Surface

# SDL\_CreateRGBSurfaceFrom

## Name

SDL\_CreateRGBSurfaceFrom — Create an SDL\_Surface from pixel data

## Synopsis

```
#include "SDL.h"
SDL_Surface *SDL_CreateRGBSurfaceFrom(void *pixels, int width, int height,
int depth, int pitch, Uint32 Rmask, Uint32 Gmask, Uint32 Bmask, Uint32
Amask);
```

## Description

Creates an SDL\_Surface from the provided pixel data.

The data stored in *pixels* is assumed to be of the *depth* specified in the parameter list. The pixel data is not copied into the SDL\_Surface structure so it should not be freed until the surface has been freed with a call to SDL\_FreeSurface. *pitch* is the length of each scanline in bytes.

See SDL\_CreateRGBSurface for a more detailed description of the other parameters.

## See Also

SDL\_CreateRGBSurface, SDL\_FreeSurface

# SDL\_FreeSurface

## Name

SDL\_FreeSurface — Frees (deletes) a SDL\_Surface

## Synopsis

```
#include "SDL.h"
void SDL_FreeSurface(SDL_Surface *surface);
```

## Description

Frees the resources used by a previously created SDL\_Surface. If the surface was created using SDL\_CreateRGBSurfaceFrom then the pixel data is not freed.

## See Also

SDL\_CreateRGBSurface SDL\_CreateRGBSurfaceFrom

# SDL\_LockSurface

## Name

SDL\_LockSurface — Lock a surface for directly access.

## Synopsis

```
#include "SDL.h"
int SDL_LockSurface(SDL_Surface *surface);
```

## Description

SDL\_LockSurface sets up a surface for directly accessing the pixels. Between calls to SDL\_LockSurface and SDL\_UnlockSurface, you can write to and read from *surface->pixels*, using the pixel format stored in *surface->format*. Once you are done accessing the surface, you should use SDL\_UnlockSurface to release it.

Not all surfaces require locking. If `SDL_MUSTLOCK(surface)` evaluates to 0, then you can read and write to the surface at any time, and the pixel format of the surface will not change.

No operating system or library calls should be made between lock/unlock pairs, as critical system locks may be held during this time.

It should be noted, that since SDL 1.1.8 surface locks are recursive. This means that you can lock a surface multiple times, but each lock must have a match unlock.

```
.
.
SDL_LockSurface( surface );
.
/* Surface is locked */
/* Direct pixel access on surface here */
.
SDL_LockSurface( surface );
.
/* More direct pixel access on surface */
.
SDL_UnlockSurface( surface );
/* Surface is still locked */
/* Note: In versions < 1.1.8, the surface would have been */
/* no longer locked at this stage */
.
```

```
SDL_UnlockSurface( surface );  
/* Surface is now unlocked */  
.  
.
```

## Return Value

SDL\_LockSurface returns 0, or -1 if the surface couldn't be locked.

## See Also

SDL\_UnlockSurface

# SDL\_UnlockSurface

## Name

SDL\_UnlockSurface — Unlocks a previously locked surface.

## Synopsis

```
#include "SDL.h"
void SDL_UnlockSurface(SDL_Surface *surface);
```

## Description

Surfaces that were previously locked using `SDL_LockSurface` must be unlocked with `SDL_UnlockSurface`. Surfaces should be unlocked as soon as possible.

It should be noted that since 1.1.8, surface locks are recursive. See `SDL_LockSurface`.

# SDL\_LoadBMP

## Name

SDL\_LoadBMP — Load a Windows BMP file into an SDL\_Surface.

## Synopsis

```
#include "SDL.h"  
SDL_Surface *SDL_LoadBMP(const char *file);
```

## Description

Loads a surface from a named Windows BMP file.

## Return Value

Returns the new surface, or NULL if there was an error.

## See Also

SDL\_SaveBMP

# SDL\_SaveBMP

## Name

SDL\_SaveBMP — Save an SDL\_Surface as a Windows BMP file.

## Synopsis

```
#include "SDL.h"
int SDL_SaveBMP(SDL_Surface *surface, const char *file);
```

## Description

Saves the SDL\_Surface *surface* as a Windows BMP file named *file*.

## Return Value

Returns 0 if successful or -1 if there was an error.

## See Also

SDL\_LoadBMP

# SDL\_SetColorKey

## Name

SDL\_SetColorKey — Sets the color key (transparent pixel) in a blittable surface and RLE acceleration.

## Synopsis

```
#include "SDL.h"
int SDL_SetColorKey(SDL_Surface *surface, Uint32 flag, Uint32 key);
```

## Description

Sets the color key (transparent pixel) in a blittable surface and enables or disables RLE blit acceleration.

RLE acceleration can substantially speed up blitting of images with large horizontal runs of transparent pixels (i.e., pixels that match the *key* value). The *key* must be of the same pixel format as the *surface*, SDL\_MapRGB is often useful for obtaining an acceptable value.

If *flag* is SDL\_SRCCOLORKEY then *key* is the transparent pixel value in the source image of a blit.

If *flag* is OR'd with SDL\_RLEACCEL then the surface will be draw using RLE acceleration when drawn with SDL\_BlitSurface. The surface will actually be encoded for RLE acceleration the first time SDL\_BlitSurface or SDL\_DisplayFormat is called on the surface.

If *flag* is 0, this function clears any current color key.

## Return Value

This function returns 0, or -1 if there was an error.

## See Also

SDL\_BlitSurface, SDL\_DisplayFormat, SDL\_MapRGB, SDL\_SetAlpha

# SDL\_SetAlpha

## Name

SDL\_SetAlpha — Adjust the alpha properties of a surface

## Synopsis

```
#include "SDL.h"
int SDL_SetAlpha(SDL_Surface *surface, Uint32 flag, Uint8 alpha);
```

## Description

**Note:** This function and the semantics of SDL alpha blending have changed since version 1.1.4. Up until version 1.1.5, an alpha value of 0 was considered opaque and a value of 255 was considered transparent. This has now been inverted: 0 (SDL\_ALPHA\_TRANSPARENT) is now considered transparent and 255 (SDL\_ALPHA\_OPAQUE) is now considered opaque.

SDL\_SetAlpha is used for setting the per-surface alpha value and/or enabling and disabling alpha blending.

The *surface* parameter specifies which surface whose alpha attributes you wish to adjust. *flags* is used to specify whether alpha blending should be used (SDL\_SRCALPHA) and whether the surface should use RLE acceleration for blitting (SDL\_RLEACCEL). *flags* can be an OR'd combination of these two options, one of these options or 0. If SDL\_SRCALPHA is not passed as a flag then all alpha information is ignored when blitting the surface. The *alpha* parameter is the per-surface alpha value; a surface need not have an alpha channel to use per-surface alpha and blitting can still be accelerated with SDL\_RLEACCEL.

**Note:** The per-surface alpha value of 128 is considered a special case and is optimised, so it's much faster than other per-surface values.

Alpha effects surface blitting in the following ways:

RGBA->RGB with SDL\_SRCALPHA

The source is alpha-blended with the destination, using the alpha channel. SDL\_SRCCOLORKEY and the per-surface alpha are ignored.

RGBA->RGB without SDL_SRCALPHA	The RGB data is copied from the source. The source alpha channel and the per-surface alpha value are ignored.
RGB->RGBA with SDL_SRCALPHA	The source is alpha-blended with the destination using the per-surface alpha value. If SDL_SRCCOLORKEY is set, only the pixels not matching the colorkey value are copied. The alpha channel of the copied pixels is set to opaque.
RGB->RGBA without SDL_SRCALPHA	The RGB data is copied from the source and the alpha value of the copied pixels is set to opaque. If SDL_SRCCOLORKEY is set, only the pixels not matching the colorkey value are copied.
RGBA->RGBA with SDL_SRCALPHA	The source is alpha-blended with the destination using the source alpha channel. The alpha channel in the destination surface is left untouched. SDL_SRCCOLORKEY is ignored.
RGBA->RGBA without SDL_SRCALPHA	The RGBA data is copied to the destination surface. If SDL_SRCCOLORKEY is set, only the pixels not matching the colorkey value are copied.
RGB->RGB with SDL_SRCALPHA	The source is alpha-blended with the destination using the per-surface alpha value. If SDL_SRCCOLORKEY is set, only the pixels not matching the colorkey value are copied.
RGB->RGB without SDL_SRCALPHA	The RGB data is copied from the source. If SDL_SRCCOLORKEY is set, only the pixels not matching the colorkey value are copied.

**Note:** Note that RGBA->RGBA blits (with SDL\_SRCALPHA set) keep the alpha of the destination surface. This means that you cannot compose two arbitrary RGBA surfaces this way and get the result you would expect from "overlaying" them; the destination alpha will work as a mask.

Also note that per-pixel and per-surface alpha cannot be combined; the per-pixel alpha is always used if available

## Return Value

This function returns 0, or -1 if there was an error.

## **See Also**

# SDL\_SetClipRect

## Name

SDL\_SetClipRect — Sets the clipping rectangle for a surface.

## Synopsis

```
#include "SDL.h"
void SDL_SetClipRect(SDL_Surface *surface, SDL_Rect *rect);
```

## Description

Sets the clipping rectangle for a surface. When this surface is the destination of a blit, only the area within the clip rectangle will be drawn into.

The rectangle pointed to by *rect* will be clipped to the edges of the surface so that the clip rectangle for a surface can never fall outside the edges of the surface.

If *rect* is NULL the clipping rectangle will be set to the full size of the surface.

## See Also

SDL\_GetClipRect, SDL\_BlitSurface, SDL\_Surface

# SDL\_GetClipRect

## Name

SDL\_GetClipRect — Gets the clipping rectangle for a surface.

## Synopsis

```
#include "SDL.h"
void SDL_GetClipRect(SDL_Surface *surface, SDL_Rect *rect);
```

## Description

Gets the clipping rectangle for a surface. When this surface is the destination of a blit, only the area within the clip rectangle is drawn into.

The rectangle pointed to by *rect* will be filled with the clipping rectangle of the surface.

## See Also

SDL\_SetClipRect, SDL\_BlitSurface, SDL\_Surface

# SDL\_ConvertSurface

## Name

SDL\_ConvertSurface — Converts a surface to the same format as another surface.

## Synopsis

```
#include "SDL.h"
SDL_Surface *SDL_ConvertSurface(SDL_Surface *src, SDL_PixelFormat *fmt,
                                Uint32 flags);
```

## Description

Creates a new surface of the specified format, and then copies and maps the given surface to it. If this function fails, it returns NULL.

The *flags* parameter is passed to SDL\_CreateRGBSurface and has those semantics.

This function is used internally by SDL\_DisplayFormat.

## Return Value

Returns either a pointer to the new surface, or NULL on error.

## See Also

SDL\_CreateRGBSurface, SDL\_DisplayFormat, SDL\_PixelFormat, SDL\_Surface

# SDL\_BlitSurface

## Name

SDL\_BlitSurface — This performs a fast blit from the source surface to the destination surface.

## Synopsis

```
#include "SDL.h"
int SDL_BlitSurface(SDL_Surface *src, SDL_Rect *srcrect, SDL_Surface *dst,
SDL_Rect *dstrect);
```

## Description

This performs a fast blit from the source surface to the destination surface.

Only the position is used in the *dstrect* (the width and height are ignored).

If either *srcrect* or *dstrect* are NULL, the entire surface (*src* or *dst*) is copied.

The final blit rectangle is saved in *dstrect* after all clipping is performed (*srcrect* is not modified).

The blit function should not be called on a locked surface.

The results of blitting operations vary greatly depending on whether SDL\_SRCALPHA is set or not. See SDL\_SetAlpha for an explanation of how this effects your results. Colorkeying and alpha attributes also interact with surface blitting, as the following pseudo-code should hopefully explain.

```
if (source surface has SDL_SRCALPHA set) {
    if (source surface has alpha channel (that is, format->Amask != 0))
        blit using per-pixel alpha, ignoring any colour key
    else {
        if (source surface has SDL_SRCCOLORKEY set)
            blit using the colour key AND the per-surface alpha value
        else
            blit using the per-surface alpha value
    }
} else {
    if (source surface has SDL_SRCCOLORKEY set)
        blit using the colour key
    else
        ordinary opaque rectangular blit
}
```

## Return Value

If the blit is successful, it returns 0, otherwise it returns -1.

If either of the surfaces were in video memory, and the blit returns -2, the video memory was lost, so it should be reloaded with artwork and re-blitted:

```
while ( SDL_BlitSurface(image, imgrect, screen, dstrect) == -2 ) {  
    while ( SDL_LockSurface(image)) < 0 )  
        Sleep(10);  
    -- Write image pixels to image->pixels --  
    SDL_UnlockSurface(image);  
}
```

This happens under DirectX 5.0 when the system switches away from your fullscreen application. Locking the surface will also fail until you have access to the video memory again.

## See Also

# SDL\_FillRect

## Name

`SDL_FillRect` — This function performs a fast fill of the given rectangle with some color

## Synopsis

```
#include "SDL.h"
int SDL_FillRect(SDL_Surface *dst, SDL_Rect *dstrect, Uint32 color);
```

## Description

This function performs a fast fill of the given rectangle with *color*. If *dstrect* is NULL, the whole surface will be filled with *color*.

The color should be a pixel of the format used by the surface, and can be generated by the `SDL_MapRGB` function.

If there is a clip rectangle set on the destination (set via `SDL_SetClipRect`) then this function will clip based on the intersection of the clip rectangle and the *dstrect* rectangle.

## Return Value

This function returns 0 on success, or -1 on error.

## See Also

`SDL_MapRGB`, `SDL_BlitterSurface`, `SDL_Rect`

# SDL\_DisplayFormat

## Name

SDL\_DisplayFormat — Convert a surface to the display format

## Synopsis

```
#include "SDL.h"
SDL_Surface *SDL_DisplayFormat(SDL_Surface *surface);
```

## Description

This function takes a surface and copies it to a new surface of the pixel format and colors of the video framebuffer, suitable for fast blitting onto the display surface. It calls SDL\_ConvertSurface

If you want to take advantage of hardware colorkey or alpha blit acceleration, you should set the colorkey and alpha value before calling this function.

If you want an alpha channel, see SDL\_DisplayFormatAlpha.

## Return Value

If the conversion fails or runs out of memory, it returns NULL

## See Also

SDL\_ConvertSurface, SDL\_DisplayFormatAlpha, SDL\_SetAlpha, SDL\_SetColorKey, SDL\_Surface

# SDL\_DisplayFormatAlpha

## Name

SDL\_DisplayFormatAlpha — Convert a surface to the display format

## Synopsis

```
#include "SDL.h"
SDL_Surface *SDL_DisplayFormatAlpha(SDL_Surface *surface);
```

## Description

This function takes a surface and copies it to a new surface of the pixel format and colors of the video framebuffer plus an alpha channel, suitable for fast blitting onto the display surface. It calls `SDL_ConvertSurface`

If you want to take advantage of hardware colorkey or alpha blit acceleration, you should set the colorkey and alpha value before calling this function.

This function can be used to convert a colourkey to an alpha channel, if the `SDL_SRCCOLORKEY` flag is set on the surface. The generated surface will then be transparent (alpha=0) where the pixels match the colourkey, and opaque (alpha=255) elsewhere.

## Return Value

If the conversion fails or runs out of memory, it returns `NULL`

## See Also

`SDL_ConvertSurface`, `SDL_SetAlpha`, `SDL_SetColorKey`, `SDL_DisplayFormat`, `SDL_Surface`

# SDL\_WarpMouse

## Name

SDL\_WarpMouse — Set the position of the mouse cursor.

## Synopsis

```
#include "SDL.h"
void SDL_WarpMouse(Uint16 x, Uint16 y);
```

## Description

Set the position of the mouse cursor (generates a mouse motion event).

## See Also

SDL\_MouseMotionEvent

# SDL\_CreateCursor

## Name

SDL\_CreateCursor — Creates a new mouse cursor.

## Synopsis

```
#include "SDL.h"
SDL_Cursor *SDL_CreateCursor(Uint8 *data, Uint8 *mask, int w, int h, int
hot_x, int hot_y);
```

## Description

Create a cursor using the specified *data* and *mask* (in MSB format). The cursor width must be a multiple of 8 bits.

The cursor is created in black and white according to the following:

Data / Mask	Resulting pixel on screen
0 / 1	White
1 / 1	Black
0 / 0	Transparent
1 / 0	Inverted color if possible, black if not.

Cursors created with this function must be freed with SDL\_FreeCursor.

## Example

```
/* Stolen from the mailing list */
/* Creates a new mouse cursor from an XPM */

/* XPM */
static const char *arrow[] = {
    /* width height num_colors chars_per_pixel */
    "    32    32        3         1",
    /* colors */
```

```

    "X c #000000",
    ". c #ffffff",
    " c None",
    /* pixels */
    "X",
    "XX",
    "X.X",
    "X..X",
    "X...X",
    "X....X",
    "X.....X",
    "X.....X",
    "X.....X",
    "X.....X",
    "X.....XXXXX",
    "X..X..X",
    "X.X X..X",
    "XX X..X",
    "X X..X",
    " X..X",
    " X..X",
    " X..X",
    " XX",

    "",
    "",
    "",
    "",
    "",
    "",
    "0,0"
};

static SDL_Cursor *init_system_cursor(const char *image[])
{
    int i, row, col;
    Uint8 data[4*32];
    Uint8 mask[4*32];
    int hot_x, hot_y;

    i = -1;
    for ( row=0; row<32; ++row ) {
        for ( col=0; col<32; ++col ) {

```

```

    if ( col % 8 ) {
        data[i] <<= 1;
        mask[i] <<= 1;
    } else {
        ++i;
        data[i] = mask[i] = 0;
    }
    switch (image[4+row][col]) {
        case 'X':
            data[i] |= 0x01;
            k[i] |= 0x01;
            break;
        case '.':
            mask[i] |= 0x01;
            break;
        case ' ':
            break;
    }
}
}
sscanf(image[4+row], "%d,%d", &hot_x, &hot_y);
return SDL_CreateCursor(data, mask, 32, 32, hot_x, hot_y);
}

```

```

## Description

Returns the currently active mouse cursor.

## See Also

SDL\_SetCursor, SDL\_CreateCursor, SDL\_ShowCursor

# SDL\_ShowCursor

## Name

SDL\_ShowCursor — Toggle whether or not the cursor is shown on the screen.

## Synopsis

```
#include "SDL.h"
int SDL_ShowCursor(int toggle);
```

## Description

Toggle whether or not the cursor is shown on the screen. Passing `SDL_ENABLE` displays the cursor and passing `SDL_DISABLE` hides it. The current state of the mouse cursor can be queried by passing `SDL_QUERY`, either `SDL_DISABLE` or `SDL_ENABLE` will be returned.

The cursor starts off displayed, but can be turned off.

## Return Value

Returns the current state of the cursor.

## See Also

`SDL_CreateCursor`, `SDL_SetCursor`

# SDL\_GL\_LoadLibrary

## Name

SDL\_GL\_LoadLibrary — Specify an OpenGL library

## Synopsis

```
#include "SDL.h"
int SDL_GL_LoadLibrary(const char *path);
```

## Description

If you wish, you may load the OpenGL library at runtime, this must be done before `SDL_SetVideoMode` is called. The *path* of the GL library is passed to `SDL_GL_LoadLibrary` and it returns 0 on success, or -1 on an error. You must then use `SDL_GL_GetProcAddress` to retrieve function pointers to GL functions.

## See Also

`SDL_GL_GetProcAddress`

# SDL\_GL\_GetProcAddress

## Name

SDL\_GL\_GetProcAddress — Get the address of a GL function

## Synopsis

```
#include "SDL.h"
void *SDL_GL_GetProcAddress(const char* proc);
```

## Description

Returns the address of the GL function *proc*, or NULL if the function is not found. If the GL library is loaded at runtime, with `SDL_GL_LoadLibrary`, then *all* GL functions must be retrieved this way. Usually this is used to retrieve function pointers to OpenGL extensions.

## Example

```
typedef void (*GL_ActiveTextureARB_Func)(unsigned int);
GL_ActiveTextureARB_Func glActiveTextureARB_ptr = 0;
int has_multitexture=1;
.
.
.
/* Get function pointer */
glActiveTextureARB_ptr=(GL_ActiveTextureARB_Func) SDL_GL_GetProcAddress("glActiveTextureARB");

/* Check for a valid function ptr */
if(!glActiveTextureARB_ptr){
    fprintf(stderr, "Multitexture Extensions not present.\n");
    has_multitexture=0;
}
.
.
.
.
if(has_multitexture){
    glActiveTextureARB_ptr(GL_TEXTURE0_ARB);
    .
}
```

```
    .  
}  
else{  
    .  
    .  
}
```

# SDL\_GL\_GetAttribute

## Name

SDL\_GL\_GetAttribute — Get the value of a special SDL/OpenGL attribute

## Synopsis

```
#include "SDL.h"
int SDL_GL_GetAttribute(SDLGLattr attr, int *value);
```

## Description

Places the value of the SDL/OpenGL attribute *attr* into *value*. This is useful after a call to `SDL_SetVideoMode` to check whether your attributes have been set as you expected.

## Return Value

Returns 0 on success, or -1 on an error.

## See Also

SDL\_GL\_SetAttribute, GL Attributes

# SDL\_GL\_SetAttribute

## Name

SDL\_GL\_SetAttribute — Set a special SDL/OpenGL attribute

## Synopsis

```
#include "SDL.h"
int SDL_GL_SetAttribute(SDL_GLattr attr, int value);
```

## Description

Sets the OpenGL attribute *attr* to *value*. The attributes you set don't take effect until after a call to `SDL_SetVideoMode`. You should use `SDL_GL_GetAttribute` to check the values after a `SDL_SetVideoMode` call.

## Return Value

Returns 0 on success, or -1 on error.

## Example

```
SDL_GL_SetAttribute( SDL_GL_RED_SIZE, 5 );
SDL_GL_SetAttribute( SDL_GL_GREEN_SIZE, 5 );
SDL_GL_SetAttribute( SDL_GL_BLUE_SIZE, 5 );
SDL_GL_SetAttribute( SDL_GL_DEPTH_SIZE, 16 );
SDL_GL_SetAttribute( SDL_GL_DOUBLEBUFFER, 1 );
if ( (screen=SDL_SetVideoMode( 640, 480, 16, SDL_OPENGL )) == NULL ) {
    fprintf(stderr, "Couldn't set GL mode: %s\n", SDL_GetError());
    SDL_Quit();
    return;
}
```

**Note:** The `SDL_DOUBLEBUF` flag is not required to enable double buffering when setting an OpenGL video mode. Double buffering is enabled or disabled using the `SDL_GL_DOUBLEBUFFER` attribute.

# SDL\_CreateYUVOverlay

## Name

SDL\_CreateYUVOverlay — Create a YUV video overlay

## Synopsis

```
#include "SDL.h"
SDL_Overlay *SDL_CreateYUVOverlay(int width, int height, Uint32 format,
SDL_Surface *display);
```

## Description

SDL\_CreateYUVOverlay creates a YUV overlay of the specified *width*, *height* and *format* (see SDL\_Overlay for a list of available formats), for the provided *display*. A SDL\_Overlay structure is returned.

The term 'overlay' is a misnomer since, unless the overlay is created in hardware, the contents for the display surface underneath the area where the overlay is shown will be overwritten when the overlay is displayed.

SDL\_Overlay, SDL\_DisplayYUVOverlay, SDL\_FreeYUVOverlay

# SDL\_LockYUVOverlay

## Name

SDL\_LockYUVOverlay — Lock an overlay

## Synopsis

```
#include "SDL.h"
int SDL_LockYUVOverlay(SDL_Overlay *overlay);
```

## Description

Much the same as SDL\_LockSurface, SDL\_LockYUVOverlay locks the *overlay* for direct access to pixel data.

## Return Value

Returns 0 on success, or -1 on an error.

## See Also

SDL\_UnlockYUVOverlay, SDL\_CreateYUVOverlay, SDL\_Overlay

# SDL\_UnlockYUVOverlay

## Name

SDL\_UnlockYUVOverlay — Unlock an overlay

## Synopsis

```
#include "SDL.h"
void SDL_UnlockYUVOverlay(SDL_Overlay *overlay);
```

## Description

The opposite to `SDL_LockYUVOverlay`. Unlocks a previously locked overlay. An overlay must be unlocked before it can be displayed.

## See Also

`SDL_UnlockYUVOverlay`, `SDL_CreateYUVOverlay`, `SDL_Overlay`

# SDL\_DisplayYUVOverlay

## Name

SDL\_DisplayYUVOverlay — Blit the overlay to the display

## Synopsis

```
#include "SDL.h"
int SDL_DisplayYUVOverlay(SDL_Overlay *overlay, SDL_Rect *dstrect);
```

## Description

Blit the *overlay* to the surface specified when it was created. The SDL\_Rect structure, *dstrect*, specifies the position and size of the destination. If the *dstrect* is a larger or smaller than the overlay then the overlay will be scaled, this is optimized for 2x scaling.

## See Also

SDL\_Overlay, SDL\_CreateYUVOverlay

# SDL\_FreeYUVOverlay

## Name

SDL\_FreeYUVOverlay — Free a YUV video overlay

## Synopsis

```
#include "SDL.h"
void SDL_FreeYUVOverlay(SDL_Overlay *overlay);
```

## Description

Frees and *overlay* created by SDL\_CreateYUVOverlay.

## See Also

# SDL\_GLattr

## Name

SDL\_GLattr — SDL GL Attributes

## Attributes

SDL_GL_RED_SIZE	Size of the framebuffer red component, in bits
SDL_GL_GREEN_SIZE	Size of the framebuffer green component, in bits
SDL_GL_BLUE_SIZE	Size of the framebuffer blue component, in bits
SDL_GL_ALPHA_SIZE	Size of the framebuffer alpha component, in bits
SDL_GL_DOUBLEBUFFER	0 or 1, enable or disable double buffering
SDL_GL_BUFFER_SIZE	Size of the framebuffer, in bits
SDL_GL_DEPTH_SIZE	Size of the depth buffer, in bits
SDL_GL_STENCIL_SIZE	Size of the stencil buffer, in bits
SDL_GL_ACCUM_RED_SIZE	Size of the accumulation buffer red component, in bits
SDL_GL_ACCUM_GREEN_SIZE	Size of the accumulation buffer green component, in bits
SDL_GL_ACCUM_BLUE_SIZE	Size of the accumulation buffer blue component, in bits
SDL_GL_ACCUM_ALPHA_SIZE	Size of the accumulation buffer alpha component, in bits

## Description

While you can set most OpenGL attributes normally, the attributes list above must be known *before* SDL sets the video mode. These attributes a set and read with `SDL_GL_SetAttribute` and `SDL_GL_GetAttribute`.

# SDL\_Color

## Name

SDL\_Color — Format independent color description

## Structure Definition

```
typedef struct{
    Uint8 r;
    Uint8 g;
    Uint8 b;
    Uint8 unused;
} SDL_Color;
```

## Structure Data

<i>r</i>	Red intensity
<i>g</i>	Green intensity
<i>b</i>	Blue intensity
<i>unused</i>	Unused

## Description

SDL\_Color describes a color in a format independent way. You can convert a SDL\_Color to a pixel value for a certain pixel format using SDL\_MapRGB.

## See Also

SDL\_PixelFormat, SDL\_SetColors, SDL\_Palette

# SDL\_Palette

## Name

SDL\_Palette — Color palette for 8-bit pixel formats

## Structure Definition

```
typedef struct{
    int ncolors;
    SDL_Color *colors;
} SDL_Palette;
```

## Structure Data

<i>ncolors</i>	Number of colors used in this palette
<i>colors</i>	Pointer to SDL_Color structures that make up the palette.

## Description

Each pixel in an 8-bit surface is an index into the *colors* field of the SDL\_Palette structure store in SDL\_PixelFormat. A SDL\_Palette should never need to be created manually. It is automatically created when SDL allocates a SDL\_PixelFormat for a surface. The colors values of a SDL\_Surfaces palette can be set with the SDL\_SetColors.

## See Also

SDL\_Color, SDL\_Surface, SDL\_SetColors SDL\_SetPalette

# SDL\_PixelFormat

## Name

SDL\_PixelFormat — Stores surface format information

## Structure Definition

```
typedef struct{
    SDL_Palette *palette;
    Uint8  BitsPerPixel;
    Uint8  BytesPerPixel;
    Uint32 Rmask, Gmask, Bmask, Amask;
    Uint8  Rshift, Gshift, Bshift, Ashift;
    Uint8  Rloss, Gloss, Bloss, Aloss;
    Uint32 colorkey;
    Uint8  alpha;
} SDL_PixelFormat;
```

## Structure Data

<i>palette</i>	Pointer to the palette, or NULL if the <i>BitsPerPixel</i> > 8
<i>BitsPerPixel</i>	The number of bits used to represent each pixel in a surface. Usually 8, 16, 24 or 32.
<i>BytesPerPixel</i>	The number of bytes used to represent each pixel in a surface. Usually one to four.
<i>[RGBA]mask</i>	Binary mask used to retrieve individual color values
<i>[RGBA]loss</i>	Precision loss of each color component ( $2^{[RGBA]loss}$ )
<i>[RGBA]shift</i>	Binary left shift of each color component in the pixel value
<i>colorkey</i>	Pixel value of transparent pixels
<i>alpha</i>	Overall surface alpha value

## Description

A SDL\_PixelFormat describes the format of the pixel data stored at the *pixels* field of a

SDL\_Surface. Every surface stores a SDL\_PixelFormat in the *format* field.

If you wish to do pixel level modifications on a surface, then understanding how SDL stores its color information is essential.

8-bit pixel formats are the easiest to understand. Since its an 8-bit format, we have 8 *BitsPerPixel* and 1 *BytesPerPixel*. Since *BytesPerPixel* is 1, all pixels are represented by a Uint8 which contains an index into *palette->colors*. So, to determine the color of a pixel in a 8-bit surface: we read the color index from *surface->pixels* and we use that index to read the SDL\_Color structure from *surface->format->palette->colors*. Like so:

```
SDL_Surface *surface;
SDL_PixelFormat *fmt;
SDL_Color *color;
Uint8 index;

.
.

/* Create surface */
.
.
fmt=surface->format;

/* Check the bitdepth of the surface */
if(fmt->BitsPerPixel!=8){
    fprintf(stderr, "Not an 8-bit surface.\n");
    return(-1);
}

/* Lock the surface */
SDL_LockSurface(surface);

/* Get the topleft pixel */
index=(Uint8 *)surface->pixels;
color=fmt->palette->colors[index];

/* Unlock the surface */
SDL_UnlockSurface(surface);
printf("Pixel Color-> Red: %d, Green: %d, Blue: %d. Index: %d\n",
        color->r, color->g, color->b, index);
.
.
```

Pixel formats above 8-bit are an entirely different experience. They are considered to be "TrueColor" formats and the color information is stored in the pixels themselves, not in a palette. The mask, shift and loss fields tell us how the color information is encoded. The mask fields allow us to isolate each color component, the shift fields tell us the number of bits to the right of each component in the pixel

value and the loss fields tell us the number of bits lost from each component when packing 8-bit color component in a pixel.

```

/* Extracting color components from a 32-bit color value */
SDL_PixelFormat *fmt;
SDL_Surface *surface;
Uint32 temp, pixel;
Uint8 red, green, blue, alpha;
.
.
.
fmt=surface->format;
SDL_LockSurface(surface);
pixel=((Uint32*)surface->pixels);
SDL_UnlockSurface(surface);

/* Get Red component */
temp=pixel&fmt->Rmask; /* Isolate red component */
temp=temp>>fmt->Rshift; /* Shift it down to 8-bit */
temp=temp<<fmt->Rloss; /* Expand to a full 8-bit number */
red=(Uint8)temp;

/* Get Green component */
temp=pixel&fmt->Gmask; /* Isolate green component */
temp=temp>>fmt->Gshift; /* Shift it down to 8-bit */
temp=temp<<fmt->Gloss; /* Expand to a full 8-bit number */
green=(Uint8)temp;

/* Get Blue component */
temp=pixel&fmt->Bmask; /* Isolate blue component */
temp=temp>>fmt->Bshift; /* Shift it down to 8-bit */
temp=temp<<fmt->Bloss; /* Expand to a full 8-bit number */
blue=(Uint8)temp;

/* Get Alpha component */
temp=pixel&fmt->Amask; /* Isolate alpha component */
temp=temp>>fmt->Ashift; /* Shift it down to 8-bit */
temp=temp<<fmt->Aloss; /* Expand to a full 8-bit number */
alpha=(Uint8)temp;

printf("Pixel Color -> R: %d, G: %d, B: %d, A: %d\n", red, green, blue, alpha);
.
.
.

```

    SDL_Rect clip_rect;                          /* Read-only */

    /* Reference count -- used when freeing surface */
    int refcount;                                /* Read-mostly */

    /* This structure also contains private fields not shown here */
} SDL_Surface;
```

## Structure Data

<i>flags</i>	Surface flags
<i>format</i>	Pixel format
<i>w, h</i>	Width and height of the surface
<i>pitch</i>	Length of a surface scanline in bytes
<i>pixels</i>	Pointer to the actual pixel data
<i>clip_rect</i>	surface clip rectangle

## Description

SDL\_Surface's represent areas of "graphical" memory, memory that can be drawn to. The video framebuffer is returned as a SDL\_Surface by `SDL_SetVideoMode` and `SDL_GetVideoSurface`. Most of the fields should be pretty obvious. *w* and *h* are the width and height of the surface in pixels. *pixels* is a pointer to the actual pixel data, the surface should be locked before accessing this field. The *clip\_rect* field is the clipping rectangle as set by `SDL_SetClipRect`.

The following are supported in the *flags* field.

SDL_SWSURFACE	Surface is stored in system memory
SDL_HWSURFACE	Surface is stored in video memory
SDL_ASYNCBLIT	Surface uses asynchronous blits if possible
SDL_ANYFORMAT	Allows any pixel-format (Display surface)
SDL_HWPALETTE	Surface has exclusive palette
SDL_DOUBLEBUF	Surface is double buffered (Display surface)
SDL_FULLSCREEN	Surface is full screen (Display Surface)
SDL_OPENGL	Surface has an OpenGL context (Display Surface)
SDL_OPENGLBLIT	Surface supports OpenGL blitting (Display Surface)
SDL_RESIZABLE	Surface is resizable (Display Surface)
SDL_HWACCEL	Surface blit uses hardware acceleration
SDL_SRCCOLORKEY	Surface use colorkey blitting
SDL_RLEACCEL	Colorkey blitting is accelerated with RLE
SDL_SRCALPHA	Surface blit uses alpha blending
SDL_PREALLOC	Surface uses preallocated memory

## See Also

SDL\_PixelFormat

# SDL\_VideoInfo

## Name

SDL\_VideoInfo — Video Target information

## Structure Definition

```
typedef struct{
    Uint32 hw_available:1;
    Uint32 wm_available:1;
    Uint32 blit_hw:1;
    Uint32 blit_hw_CC:1;
    Uint32 blit_hw_A:1;
    Uint32 blit_sw:1;
    Uint32 blit_sw_CC:1;
    Uint32 blit_sw_A:1;
    Uint32 blit_fill;
    Uint32 video_mem;
    SDL_PixelFormat *vfmt;
} SDL_VideoInfo;
```

## Structure Data

<i>hw_available</i>	Is it possible to create hardware surfaces?
<i>wm_available</i>	Is there a window manager available
<i>blit_hw</i>	Are hardware to hardware blits accelerated?
<i>blit_hw_CC</i>	Are hardware to hardware colorkey blits accelerated?
<i>blit_hw_A</i>	Are hardware to hardware alpha blits accelerated?
<i>blit_sw</i>	Are software to hardware blits accelerated?
<i>blit_sw_CC</i>	Are software to hardware colorkey blits accelerated?
<i>blit_sw_A</i>	Are software to hardware alpha blits accelerated?
<i>blit_fill</i>	Are color fills accelerated?
<i>video_mem</i>	Total amount of video memory in Kilobytes
<i>vfmt</i>	Pixel format of the video device

## Description

This (read-only) structure is returned by `SDL_GetVideoInfo`. It contains information on either the 'best' available mode (if called before `SDL_SetVideoMode`) or the current video mode.

## See Also

`SDL_PixelFormat`, `SDL_GetVideoInfo`

# SDL\_Overlay

## Name

SDL\_Overlay — YUV video overlay

## Structure Definition

```
typedef struct{
    Uint32 format;
    int w, h;
    int planes;
    Uint16 *pitches;
    Uint8 **pixels;
    Uint32 hw_overlay:1;
} SDL_Overlay;
```

## Structure Data

<i>format</i>	Overlay format (see below)
<i>w, h</i>	Width and height of overlay
<i>planes</i>	Number of planes in the overlay. Usually either 1 or 3
<i>pitches</i>	An array of pitches, one for each plane. Pitch is the length of a row in bytes.
<i>pixels</i>	An array of pointers to the data of each plane. The overlay should be locked before these pointers are used.
<i>hw_overlay</i>	This will be set to 1 if the overlay is hardware accelerated.

## Description

A SDL\_Overlay is similar to a SDL\_Surface except it stores a YUV overlay. All the fields are read only, except for *pixels* which should be locked before use. The *format* field stores the format of the overlay which is one of the following:

```
#define SDL_YV12_OVERLAY 0x32315659 /* Planar mode: Y + V + U */
#define SDL_IYUV_OVERLAY 0x56555949 /* Planar mode: Y + U + V */
#define SDL_YUY2_OVERLAY 0x32595559 /* Packed mode: Y0+U0+Y1+V0 */
```

```
#define SDL_UYVY_OVERLAY 0x59565955 /* Packed mode: U0+Y0+V0+Y1 */  
#define SDL_YVYU_OVERLAY 0x55595659 /* Packed mode: Y0+V0+Y1+U0 */
```

More information on YUV formats can be found at <http://www.webartz.com/fourcc/indexyuv.htm>.

# Chapter 7. Window Management

SDL provides a small set of window management functions which allow applications to change their title and toggle from windowed mode to fullscreen (if available)

## SDL\_WM\_SetCaption

### Name

`SDL_WM_SetCaption` — Sets the window title and icon name.

### Synopsis

```
#include "SDL.h"
void SDL_WM_SetCaption(const char *title, const char *icon);
```

### Description

Sets the title-bar and icon name of the display window.

### See Also

`SDL_WM_GetCaption`, `SDL_WM_SetIcon`

# SDL\_WM\_GetCaption

## Name

SDL\_WM\_GetCaption — Gets the window title and icon name.

## Synopsis

```
#include "SDL.h"
void SDL_WM_GetCaption(char **title, char **icon);
```

## Description

Set pointers to the window *title* and *icon* name.

## See Also

SDL\_WM\_SetCaption, SDL\_WM\_SetIcon

# SDL\_WM\_SetIcon

## Name

SDL\_WM\_SetIcon — Sets the icon for the display window.

## Synopsis

```
#include "SDL.h"
void SDL_WM_SetIcon(SDL_Surface *icon, Uint8 *mask);
```

## Description

Sets the icon for the display window.

This function must be called before the first call to SDL\_SetVideoMode.

It takes an *icon* surface, and a *mask* in MSB format.

If *mask* is NULL, the entire icon surface will be used as the icon.

## Example

```
SDL_WM_SetIcon(SDL_LoadBMP("icon.bmp"), NULL);
```

## See Also

SDL\_SetVideoMode, SDL\_WM\_SetCaption

# SDL\_WM\_IconifyWindow

## Name

SDL\_WM\_IconifyWindow — Iconify/Minimise the window

## Synopsis

```
#include "SDL.h"
int SDL_WM_IconifyWindow(void);
```

## Description

If the application is running in a window managed environment SDL attempts to iconify/minimise it. If `SDL_WM_IconifyWindow` is successful, the application will receive a `SDL_APPACTIVE` loss event.

## Return Value

Returns non-zero on success or 0 if iconification is not support or was refused by the window manager.

# SDL\_WM\_ToggleFullScreen

## Name

SDL\_WM\_ToggleFullScreen — Toggles fullscreen mode

## Synopsis

```
#include "SDL.h"
int SDL_WM_ToggleFullScreen(SDL_Surface *surface);
```

## Description

Toggles the application between windowed and fullscreen mode, if supported. (X11 is the only target currently supported, BeOS support is experimental).

## Return Value

Returns 0 on failure or 1 on success.

# SDL\_WM\_GrabInput

## Name

SDL\_WM\_GrabInput — Grabs mouse and keyboard input.

## Synopsis

```
#include "SDL.h"
SDL_GrabMode SDL_WM_GrabInput(SDL_GrabMode mode);
```

## Description

Grabbing means that the mouse is confined to the application window, and nearly all keyboard input is passed directly to the application, and not interpreted by a window manager, if any.

When *mode* is `SDL_GRAB_QUERY` the grab mode is not changed, but the current grab mode is returned.

```
typedef enum {
    SDL_GRAB_QUERY,
    SDL_GRAB_OFF,
    SDL_GRAB_ON
} SDL_GrabMode;
```

## Return Value

The current/new `SDL_GrabMode`.

# Chapter 8. Events

## Introduction

Event handling allows your application to receive input from the user. Event handling is initialised (along with video) with a call to:

```
SDL_Init(SDL_INIT_VIDEO);
```

Internally, SDL stores all the events waiting to be handled in an event queue. Using functions like `SDL_PollEvent` and `SDL_PeepEvents` you can observe and handle waiting input events.

The key to event handling in SDL is the `SDL_Event` union. The event queue itself is composed of a series of `SDL_Event` unions, one for each waiting event. `SDL_Event` unions are read from the queue with the `SDL_PollEvent` function and it is then up to the application to process the information stored with them.

## SDL Event Structures.

### SDL\_Event

#### Name

`SDL_Event` — General event structure

#### Structure Definition

```
typedef union{
    Uint8 type;
    SDL_ActiveEvent active;
    SDL_KeyboardEvent key;
    SDL_MouseMotionEvent motion;
    SDL_MouseButtonEvent button;
    SDL_JoyAxisEvent jaxis;
    SDL_JoyBallEvent jball;
    SDL_JoyHatEvent jhat;
    SDL_JoyButtonEvent jbutton;
    SDL_ResizeEvent resize;
    SDL_QuitEvent quit;
```

```

    SDL_UserEvent user;
    SDL_SysWMEvent syswm;
} SDL_Event;

```

## Structure Data

<i>type</i>	The type of event
<i>active</i>	Activation event
<i>key</i>	Keyboard event
<i>motion</i>	Mouse motion event
<i>button</i>	Mouse button event
<i>jaxis</i>	Joystick axis motion event
<i>jball</i>	Joystick trackball motion event
<i>jhat</i>	Joystick hat motion event
<i>jbutton</i>	Joystick button event
<i>resize</i>	Application window resize event
<i>quit</i>	Application quit request event
<i>user</i>	User defined event
<i>syswm</i>	Undefined window manager event

## Description

The `SDL_Event` union is the core to all event handling in SDL, it's probably the most important structure after `SDL_Surface`. `SDL_Event` is a union of all event structures used in SDL, using it is a simple matter of knowing which union member relates to which event *type*.

Event <i>type</i>	Event Structure
SDL_ACTIVEEVENT	SDL_ActiveEvent
SDL_KEYDOWN/UP	SDL_KeyboardEvent
SDL_MOUSEMOTION	SDL_MouseMotionEvent
SDL_MOUSEBUTTONDOWN/UP	SDL_MouseButtonEvent
SDL_JOYAXISMOTION	SDL_JoyAxisEvent
SDL_JOYBALLMOTION	SDL_JoyBallEvent
SDL_JOYHATMOTION	SDL_JoyHatEvent
SDL_JOYBUTTONDOWN/UP	SDL_JoyButtonEvent
SDL_QUIT	SDL_QuitEvent

Event <i>type</i>	Event Structure
SDL_SYSWMEVENT	SDL_SysWMEvent
SDL_VIDEORESIZE	SDL_ResizeEvent
SDL_USEREVENT	SDL_UserEvent

## Use

The `SDL_Event` structure has two uses

- Reading events on the event queue
- Placing events on the event queue

Reading events from the event queue is done with either `SDL_PollEvent` or `SDL_PeepEvents`. We'll use `SDL_PollEvent` and step through an example.

First off, we create an empty `SDL_Event` structure.

```
SDL_Event test_event;
```

`SDL_PollEvent` removes the next event from the event queue, if there are no events on the queue it returns 0 otherwise it returns 1. We use a `while` loop to process each event in turn.

```
while(SDL_PollEvent(&test_event)) {
```

The `SDL_PollEvent` function take a pointer to an `SDL_Event` structure that is to be filled with event information. We know that if `SDL_PollEvent` removes an event from the queue then the event information will be placed in our `test_event` structure, but we also know that the *type* of event will be placed in the *type* member of `test_event`. So to handle each event *type* separately we use a `switch` statement.

```
    switch(test_event.type) {
```

We need to know what kind of events we're looking for *and* the event *type*'s of those events. So lets assume we want to detect where the user is moving the mouse pointer within our application. We look through our event types and notice that `SDL_MOUSEMOTION` is, more than likely, the event we're looking for. A little more research tells use that `SDL_MOUSEMOTION` events are handled within the `SDL_MouseMotionEvent` structure which is the *motion* member of `SDL_Event`. We can check for the `SDL_MOUSEMOTION` event *type* within our `switch` statement like so:

```
        case SDL_MOUSEMOTION:
```

All we need do now is read the information out of the *motion* member of `test_event`.

```
            printf("We got a motion event.\n");
```

```

        printf("Current mouse position is: (%d, %d)\n", test_event.motion.x, test_event.mo
        break;
    default:
        printf("Unhandled Event!\n");
        break;
    }
}
printf("Event queue empty.\n");

```

It is also possible to push events onto the event queue and so use it as a two-way communication path. Both `SDL_PushEvent` and `SDL_PeepEvents` allow you to place events onto the event queue. This is usually used to place a `SDL_USEREVENT` on the event queue, however you could use it to post fake input events if you wished. Creating your own events is a simple matter of choosing the event type you want, setting the *type* member and filling the appropriate member structure with information.

```

SDL_Event user_event;

user_event.type=SDL_USEREVENT;
user_event.user.code=2;
user_event.user.data1=NULL;
user_event.user.data2=NULL;
SDL_PushEvent(&user_event);

```

## See Also

`SDL_PollEvent`, `SDL_PushEvent`, `SDL_PeepEvents`

# SDL\_ActiveEvent

## Name

SDL\_ActiveEvent — Application visibility event structure

## Structure Definition

```
typedef struct{
    Uint8 type;
    Uint8 gain;
    Uint8 state;
} SDL_ActiveEvent;
```

## Structure Data

<i>type</i>	SDL_ACTIVEEVENT.
<i>gain</i>	0 if the event is a loss or 1 if it is a gain.
<i>state</i>	SDL_APPMOUSEFOCUS if mouse focus was gained or lost, SDL_APPINPUTFOCUS if input focus was gained or lost, or SDL_APPACTIVE if the application was iconified ( <i>gain</i> =0) or restored( <i>gain</i> =1).

## Description

SDL\_ActiveEvent is a member of the SDL\_Event union and is used when an event of type SDL\_ACTIVEEVENT is reported.

When the mouse leaves or enters the window area a SDL\_APPMOUSEFOCUS type activation event occurs, if the mouse entered the window then *gain* will be 1, otherwise *gain* will be 0. A SDL\_APPINPUTFOCUS type activation event occurs when the application loses or gains keyboard focus. This usually occurs when another application is made active. Finally, a SDL\_APPACTIVE type event occurs when the application is either minimised/iconified (*gain*=0) or restored.

**Note:** This event does not occur when an application window is first created.

## **See Also**

SDL\_Event, SDL\_GetAppState

# SDL\_KeyboardEvent

## Name

SDL\_KeyboardEvent — Keyboard event structure

## Structure Definition

```
typedef struct{
    Uint8 type;
    Uint8 state;
    SDL_keysym keysym;
} SDL_KeyboardEvent;
```

## Structure Data

<i>type</i>	SDL_KEYDOWN or SDL_KEYUP
<i>state</i>	SDL_PRESSED or SDL_RELEASED
<i>keysym</i>	Contains key press information

## Description

SDL\_KeyboardEvent is a member of the SDL\_Event union and is used when an event of type SDL\_KEYDOWN or SDL\_KEYUP is reported.

The *type* and *state* actually report the same information, they just use different values to do it! A keyboard event occurs when a key is released (*type*=SDL\_KEYUP or *state*=SDL\_RELEASED) and when a key is pressed (*type*=SDL\_KEYDOWN or *state*=SDL\_PRESSED). The information on what key was pressed or released is in the keysym structure.

**Note:** Repeating SDL\_KEYDOWN events will occur if key repeat is enabled (see SDL\_EnableKeyRepeat).

## See Also

SDL\_Event, SDL\_keysym, SDL\_EnableKeyRepeat, SDL\_EnableUNICODE

# SDL\_MouseMotionEvent

## Name

SDL\_MouseMotionEvent — Mouse motion event structure

## Structure Definition

```
typedef struct{
    Uint8 type;
    Uint8 state;
    Uint16 x, y;
    Sint16 xrel, yrel;
} SDL_MouseMotionEvent;
```

## Structure Data

<i>type</i>	SDL_MOUSEMOTION
<i>state</i>	The current button state
<i>x, y</i>	The X/Y coordinates of the mouse
<i>xrel, yrel</i>	Relative motion in the X/Y direction

## Description

SDL\_MouseMotionEvent is a member of the SDL\_Event union and is used when an event of type SDL\_MOUSEMOTION is reported.

Simply put, a SDL\_MOUSEMOTION type event occurs when a user moves the mouse within the application window or when SDL\_WarpMouse is called. Both the absolute (*x* and *y*) and relative (*xrel* and *yrel*) coordinates are reported along with the current button states (*state*). The button state can be interpreted using the SDL\_BUTTON macro (see SDL\_GetMouseState).

If the cursor is hidden (SDL\_ShowCursor(0)) and the input is grabbed (SDL\_WM\_GrabInput(SDL\_GRAB\_ON)), then the mouse will give relative motion events even when the cursor reaches the edge of the screen. This is currently only implemented on Windows and Linux/Unix-a-likes.

*SDL\_MouseMotionEvent*

## **See Also**

SDL\_Event, SDL\_MouseButtonEvent

# SDL\_MouseButtonEvent

## Name

SDL\_MouseButtonEvent — Mouse button event structure

## Structure Definition

```
typedef struct{
    Uint8 type;
    Uint8 button;
    Uint8 state;
    Uint16 x, y;
} SDL_MouseButtonEvent;
```

## Structure Data

<i>type</i>	SDL_MOUSEBUTTONDOWN or SDL_MOUSEBUTTONUP
<i>button</i>	The mouse button index (SDL_BUTTON_LEFT, SDL_BUTTON_MIDDLE, SDL_BUTTON_RIGHT)
<i>state</i>	SDL_PRESSED or SDL_RELEASED
<i>x, y</i>	The X/Y coordinates of the mouse at press/release time

## Description

SDL\_MouseButtonEvent is a member of the SDL\_Event union and is used when an event of type SDL\_MOUSEBUTTONDOWN or SDL\_MOUSEBUTTONUP is reported.

When a mouse button press or release is detected then number of the button pressed (from 1 to 255, with 1 usually being the left button and 2 the right) is placed into *button*, the position of the mouse when this event occurred is stored in the *x* and the *y* fields. Like SDL\_KeyboardEvent, information on whether the event was a press or a release event is stored in both the *type* and *state* fields, but this should be obvious.

*SDL\_MouseButtonEvent*

## **See Also**

SDL\_Event, SDL\_MouseMotionEvent

# SDL\_JoyAxisEvent

## Name

SDL\_JoyAxisEvent — Joystick axis motion event structure

## Structure Definition

```
typedef struct{
    Uint8 type;
    Uint8 which;
    Uint8 axis;
    Sint16 value;
} SDL_JoyAxisEvent;
```

## Structure Data

<i>type</i>	SDL_JOYAXISMOTION
<i>which</i>	Joystick device index
<i>axis</i>	Joystick axis index
<i>value</i>	Axis value (range: -32768 to 32767)

## Description

SDL\_JoyAxisEvent is a member of the SDL\_Event union and is used when an event of type SDL\_JOYAXISMOTION is reported.

A SDL\_JOYAXISMOTION event occurs when ever a user moves an axis on the joystick. The field *which* is the index of the joystick that reported the event and *axis* is the index of the axis (for a more detailed explanation see the Joystick section). *value* is the current position of the axis.

## See Also

SDL\_Event, Joystick Functions, SDL\_JoystickEventState, SDL\_JoystickGetAxis

# SDL\_JoyButtonEvent

## Name

SDL\_JoyButtonEvent — Joystick button event structure

## Structure Definition

```
typedef struct{
    Uint8 type;
    Uint8 which;
    Uint8 button;
    Uint8 state;
} SDL_JoyButtonEvent;
```

## Structure Data

<i>type</i>	SDL_JOYBUTTONDOWN or SDL_JOYBUTTONUP
<i>which</i>	Joystick device index
<i>button</i>	Joystick button index
<i>state</i>	SDL_PRESSED or SDL_RELEASED

## Description

SDL\_JoyButtonEvent is a member of the SDL\_Event union and is used when an event of type SDL\_JOYBUTTONDOWN or SDL\_JOYBUTTONUP is reported.

A SDL\_JOYBUTTONDOWN or SDL\_JOYBUTTONUP event occurs when ever a user presses or releases a button on a joystick. The field *which* is the index of the joystick that reported the event and *button* is the index of the button (for a more detailed explanation see the Joystick section). *state* is the current state or the button which is either SDL\_PRESSED or SDL\_RELEASED.

## See Also

SDL\_Event, Joystick Functions, SDL\_JoystickEventState, SDL\_JoystickGetButton

# SDL\_JoyHatEvent

## Name

SDL\_JoyHatEvent — Joystick hat position change event structure

## Structure Definition

```
typedef struct{
    Uint8 type;
    Uint8 which;
    Uint8 hat;
    Uint8 value;
} SDL_JoyHatEvent;
```

## Structure Data

<i>type</i>	SDL_JOY
<i>which</i>	Joystick device index
<i>hat</i>	Joystick hat index
<i>value</i>	Hat position

## Description

SDL\_JoyHatEvent is a member of the SDL\_Event union and is used when an event of type SDL\_JOYHATMOTION is reported.

A SDL\_JOYHATMOTION event occurs when ever a user moves a hat on the joystick. The field *which* is the index of the joystick that reported the event and *hat* is the index of the hat (for a more detailed explanation see the Joystick section). *value* is the current position of the hat. It is a logically OR'd combination of the following values (whose meanings should be pretty obvious):

```
SDL_HAT_CENTERED
SDL_HAT_UP
SDL_HAT_RIGHT
SDL_HAT_DOWN
SDL_HAT_LEFT
```

The following defines are also provided:

```
SDL_HAT_RIGHTUP
```

SDL\_HAT\_RIGHTDOWN  
SDL\_HAT\_LEFTUP  
SDL\_HAT\_LEFTDOWN

## **See Also**

SDL\_Event, Joystick Functions, SDL\_JoystickEventState, SDL\_JoystickGetHat

# SDL\_JoyBallEvent

## Name

SDL\_JoyBallEvent — Joystick trackball motion event structure

## Structure Definition

```
typedef struct{
    Uint8 type;
    Uint8 which;
    Uint8 ball;
    Sint16 xrel, yrel;
} SDL_JoyBallEvent;
```

## Structure Data

<i>type</i>	SDL_JOYBALLMOTION
<i>which</i>	Joystick device index
<i>ball</i>	Joystick trackball index
<i>xrel, yrel</i>	The relative motion in the X/Y direction

## Description

SDL\_JoyBallEvent is a member of the SDL\_Event union and is used when an event of type SDL\_JOYBALLMOTION is reported.

A SDL\_JOYBALLMOTION event occurs when a user moves a trackball on the joystick. The field *which* is the index of the joystick that reported the event and *ball* is the index of the trackball (for a more detailed explanation see the Joystick section). Trackballs only return relative motion, this is the change in position on the ball since it was last polled (last cycle of the event loop) and it is stored in *xrel* and *yrel*.

## See Also

SDL\_Event, Joystick Functions, SDL\_JoystickEventState, SDL\_JoystickGetBall

# SDL\_ResizeEvent

## Name

SDL\_ResizeEvent — Window resize event structure

## Structure Definition

```
typedef struct{
    Uint8 type;
    int w, h;
} SDL_ResizeEvent;
```

## Structure Data

<i>type</i>	SDL_VIDEORESIZE
<i>w, h</i>	New width and height of the window

## Description

SDL\_ResizeEvent is a member of the SDL\_Event union and is used when an event of type SDL\_VIDEORESIZE is reported.

When SDL\_RESIZABLE is passed as a *flag* to SDL\_SetVideoMode the user is allowed to resize the applications window. When the window is resized an SDL\_VIDEORESIZE is report, with the new window width and height values stored in *w* and *h*, respectively. When an SDL\_VIDEORESIZE is recieved the window should be resized to the new dimensions using SDL\_SetVideoMode.

## See Also

SDL\_Event, SDL\_SetVideoMode

# SDL\_SysWMEvent

## Name

SDL\_SysWMEvent — Platform-dependent window manager event.

## Description

The system window manager event contains a pointer to system-specific information about unknown window manager events. If you enable this event using `SDL_EventState()`, it will be generated whenever unhandled events are received from the window manager. This can be used, for example, to implement cut-and-paste in your application.

```
typedef struct {  
    Uint8 type;    /* Always SDL_SysWM */  
} SDL_SysWMEvent;
```

If you want to obtain system-specific information about the window manager, you can fill the version member of a `SDL_SysWMInfo` structure (details can be found in `SDL_syswm.h`, which must be included) using the `SDL_VERSION()` macro found in `SDL_version.h`, and pass it to the function:

```
int SDL_GetWMInfo(SDL_SysWMInfo *info);
```

## See Also

`SDL_EventState`

# SDL\_UserEvent

## Name

SDL\_UserEvent — A user-defined event type

## Structure Definition

```
typedef struct{
    Uint8 type;
    int code;
    void *data1;
    void *data2;
} SDL_UserEvent;
```

## Structure Data

<i>type</i>	SDL_USEREVENT through to SDL_NUMEVENTS-1
<i>code</i>	User defined event code
<i>data1</i>	User defined data pointer
<i>data2</i>	User defined data pointer

## Description

SDL\_UserEvent is in the *user* member of the structure SDL\_Event. This event is unique, it is never created by SDL but only by the user. The event can be pushed onto the event queue using SDL\_PushEvent. The contents of the structure members or completely up to the programmer, the only requirement is that *type* is a value from SDL\_USEREVENT to SDL\_NUMEVENTS-1 (inclusive).

## Examples

```
SDL_Event event;

event.type = SDL_USEREVENT;
event.user.code = my_event_code;
event.user.data1 = significant_data;
event.user.data2 = 0;
SDL_PushEvent(&event);
```

## **See Also**

SDL\_Event, SDL\_PushEvent

# SDL\_QuitEvent

## Name

SDL\_QuitEvent — Quit requested event

## Structure Definition

```
typedef struct{
    Uint8 type
} SDL_QuitEvent;
```

## Structure Data

*type* SDL\_QUIT

## Description

SDL\_QuitEvent is a member of the SDL\_Event union and is used when an event of type SDL\_QUIT is reported.

As can be seen, the SDL\_QuitEvent structure serves no useful purpose. The event itself, on the other hand, is very important. If you filter out or ignore a quit event then it is impossible for the user to close the window. On the other hand, if you do accept a quit event then the application window will be closed, and screen updates will still report success event though the application will no longer be visible.

**Note:** The macro `SDL_QuitRequested` will return non-zero if a quit event is pending

## See Also

SDL\_Event, SDL\_SetEventFilter

# SDL\_keysym

## Name

SDL\_keysym — Keysym structure

## Structure Definition

```
typedef struct{
    Uint8 scancode;
    SDLKey sym;
    SDLMod mod;
    Uint16 unicode;
} SDL_keysym;
```

## Structure Data

<i>scancode</i>	Hardware specific scancode
<i>sym</i>	SDL virtual keysym
<i>mod</i>	Current key modifiers
<i>unicode</i>	Translated character

## Description

The SDL\_keysym structure is used by reporting key presses and releases since it is a part of the SDL\_KeyboardEvent.

The *scancode* field should generally be left alone, it is the hardware dependent scancode returned by the keyboard. The *sym* field is extremely useful. It is the SDL-defined value of the key (see SDL Key Syms. This field is very useful when you are checking for certain key presses, like so:

```
.
.
while(SDL_PollEvent(&event)){
    switch(event.type){
        case SDL_KEYDOWN:
            if(event.key.keysym.sym==SDLK_LEFT)
                move_left();
            break;
        .
        .
    }
```

```

    }
}
.
.

```

*mod* stores the current state of the keyboard modifiers as explained in `SDL_GetModState`. The *unicode* is only used when UNICODE translation is enabled with `SDL_EnableUNICODE`. If *unicode* is non-zero then this is the UNICODE character corresponding to the keypress. If the high 9 bits of the character are 0, then this maps to the equivalent ASCII character:

```

char ch;
if ( (keysym.unicode & 0xFF80) == 0 ) {
    ch = keysym.unicode & 0x7F;
}
else {
    printf("An International Character.\n");
}

```

UNICODE translation does have a slight overhead so don't enable it unless its needed.

## Event Functions.

### SDL\_PumpEvents

#### Name

`SDL_PumpEvents` — Pumps the event loop, gathering events from the input devices.

#### Synopsis

```
#include "SDL.h"
void SDL_PumpEvents(void);
```

#### Description

Pumps the event loop, gathering events from the input devices.

`SDL_PumpEvents` gathers all the pending input information from devices and places it on the event queue. Without calls to `SDL_PumpEvents` no events would ever be placed on the queue. Often calls the need for `SDL_PumpEvents` is hidden from the user since `SDL_PollEvent` and `SDL_WaitEvent` implicitly call `SDL_PumpEvents`. However, if you are not polling or waiting for events (e.g. your filtering them), then you must call `SDL_PumpEvents` to force an event queue update.

**Note:** You can only call this function in the thread that set the video mode.

#### See Also

`SDL_PollEvent`

# SDL\_PeepEvents

## Name

SDL\_PeepEvents — Checks the event queue for messages and optionally returns them.

## Synopsis

```
#include "SDL.h"
int SDL_PeepEvents(SDL_Event *events, int numevents, SDL_eventaction
action, Uint32 mask);
```

## Description

Checks the event queue for messages and optionally returns them.

If *action* is SDL\_ADDEVENT, up to *numevents* events will be added to the back of the event queue.

If *action* is SDL\_PEEKEVENT, up to *numevents* events at the front of the event queue, matching *mask*, will be returned and will not be removed from the queue.

If *action* is SDL\_GETEVENT, up to *numevents* events at the front of the event queue, matching *mask*, will be returned and will be removed from the queue.

This function is thread-safe.

## Return Value

This function returns the number of events actually stored, or -1 if there was an error.

## See Also

SDL\_Event, SDL\_PollEvent, SDL\_PushEvent

# SDL\_PollEvent

## Name

SDL\_PollEvent — Polls for currently pending events.

## Synopsis

```
#include "SDL.h"
int SDL_PollEvent(SDL_Event *event);
```

## Description

Polls for currently pending events, and returns 1 if there are any pending events, or 0 if there are none available.

If *event* is not NULL, the next event is removed from the queue and stored in that area.

## Examples

```
SDL_Event event; /* Event structure */

.
.
.
/* Check for events */
while(SDL_PollEvent(&event)){ /* Loop until there are no events left on the queue */
    switch(event.type){ /* Process the appropriate event type */
        case SDL_KEYDOWN: /* Handle a KEYDOWN event */
            printf("Oh! Key press\n");
            break;
        case SDL_MOUSEMOTION:
            .
            .
            .
        default: /* Report an unhandled event */
            printf("I don't know what this event is!\n");
    }
}
```

## **See Also**

SDL\_Event, SDL\_WaitEvent, SDL\_PeepEvents

# SDL\_WaitEvent

## Name

SDL\_WaitEvent — Waits indefinitely for the next available event.

## Synopsis

```
#include "SDL.h"
int SDL_WaitEvent(SDL_Event *event);
```

## Description

Waits indefinitely for the next available event, returning 1, or 0 if there was an error while waiting for events.

If *event* is not NULL, the next event is removed from the queue and stored in that area.

## See Also

SDL\_Event, SDL\_PollEvent

# SDL\_PushEvent

## Name

SDL\_PushEvent — Pushes an event onto the event queue

## Synopsis

```
#include "SDL.h"
int SDL_PushEvent(SDL_Event *event);
```

## Description

The event queue can actually be used as a two way communication channel. Not only can events be read from the queue, but the user can also push their own events onto it. *event* is a pointer to the event structure you wish to push onto the queue.

**Note:** Pushing device input events onto the queue doesn't modify the state of the device within SDL.

## Return Value

Returns 0 on success or -1 if the event couldn't be pushed.

## Examples

See SDL\_Event.

## See Also

SDL\_PollEvent, SDL\_PeepEvents, SDL\_Event

# SDL\_SetEventFilter

## Name

`SDL_SetEventFilter` — Sets up a filter to process all events before they are posted to the event queue.

## Synopsis

```
#include "SDL.h"
void SDL_SetEventFilter(SDL_EventFilter filter);
```

## Description

This function sets up a filter to process all events before they are posted to the event queue. This is a very powerful and flexible feature. The filter is prototyped as:

```
typedef int (*SDL_EventFilter)(const SDL_Event *event);
```

If the filter returns 1, then the event will be added to the internal queue. If it returns 0, then the event will be dropped from the queue. This allows selective filtering of dynamically.

There is one caveat when dealing with the `SDL_QUITEVENT` event type. The event filter is only called when the window manager desires to close the application window. If the event filter returns 1, then the window will be closed, otherwise the window will remain open if possible. If the quit event is generated by an interrupt signal, it will bypass the internal queue and be delivered to the application at the next event poll.

**Note:** Events pushed onto the queue with `SDL_PushEvent` or `SDL_PeepEvents` do not get passed through the event filter.

**Note:** *Be Careful!* The event filter function may run in a different thread so be careful what you do within it.

## **See Also**

SDL\_Event, SDL\_GetEventFilter, SDL\_PushEvent

# SDL\_GetEventFilter

## Name

SDL\_GetEventFilter — Retrieves a pointer to the event filter

## Synopsis

```
#include "SDL.h"
SDL_EventFilter SDL_GetEventFilter(void);
```

## Description

This function retrieves a pointer to the event filter that was previously set using `SDL_SetEventFilter`. An `SDL_EventFilter` function is defined as:

```
typedef int (*SDL_EventFilter)(const SDL_Event *event);
```

## Return Value

Returns a pointer to the event filter or `NULL` if no filter has been set.

## See Also

SDL\_Event, SDL\_SetEventFilter

# SDL\_EventState

## Name

SDL\_EventState — This function allows you to set the state of processing certain events.

## Synopsis

```
#include "SDL.h"
Uint8 SDL_EventState(Uint8 type, int state);
```

## Description

This function allows you to set the state of processing certain event *type*'s.

If *state* is set to `SDL_IGNORE`, that event *type* will be automatically dropped from the event queue and will not be filtered.

If *state* is set to `SDL_ENABLE`, that event *type* will be processed normally.

If *state* is set to `SDL_QUERY`, `SDL_EventState` will return the current processing state of the specified event *type*.

A list of event *type*'s can be found in the `SDL_Event` section.

## See Also

`SDL_Event`

# SDL\_GetKeyState

## Name

SDL\_GetKeyState — Get a snapshot of the current keyboard state

## Synopsis

```
#include "SDL.h"
Uint8 *SDL_GetKeyState(int *numkeys);
```

## Description

Gets a snapshot of the current keyboard state. The current state is return as a pointer to an array, the size of this array is stored in *numkeys*. The array is indexed by the SDLK\_\* symbols. A value of 1 means the key is pressed and a value of 0 means its not.

**Note:** Use SDL\_PumpEvents to update the state array.

## Example

```
Uint8 *keystate = SDL_GetKeyState(NULL);
if ( keystate[SDLK_RETURN] ) printf("Return Key Pressed.\n");
```

## See Also

SDL\_Key Symbols, SDL\_PumpEvents

# SDL\_GetModState

## Name

SDL\_GetModState — Get the state of modifier keys.

## Synopsis

```
#include "SDL.h"
SDLMod SDL_GetModState(void);
```

## Description

Returns the current of the modifier keys (CTRL, ALT, etc.).

## Return Value

The return value can be an OR'd combination of the SDLMod enum.

## SDLMod

```
typedef enum {
    KMOD_NONE = 0x0000,
    KMOD_LSHIFT= 0x0001,
    KMOD_RSHIFT= 0x0002,
    KMOD_LCTRL = 0x0040,
    KMOD_RCTRL = 0x0080,
    KMOD_LALT = 0x0100,
    KMOD_RALT = 0x0200,
    KMOD_LMETA = 0x0400,
    KMOD_RMETA = 0x0800,
    KMOD_NUM = 0x1000,
    KMOD_CAPS = 0x2000,
    KMOD_MODE = 0x4000,
} SDLMod;
```

SDL also defines the following symbols for convenience:

```
#define KMOD_CTRL (KMOD_LCTRL|KMOD_RCTRL)
#define KMOD_SHIFT (KMOD_LSHIFT|KMOD_RSHIFT)
#define KMOD_ALT (KMOD_LALT|KMOD_RALT)
#define KMOD_META (KMOD_LMETA|KMOD_RMETA)
```

## **See Also**

`SDL_GetKeyState`

# SDL\_SetModState

## Name

SDL\_SetModState — Set the current key modifier state

## Synopsis

```
#include "SDL.h"
void SDL_SetModState(SDLMod modstate);
```

## Description

The inverse of `SDL_GetModState`, `SDL_SetModState` allows you to impose modifier key states on your application.

Simply pass your desired modifier states into *modstate*. This value may be a logical OR'd combination of the following:

```
typedef enum {
    KMOD_NONE    = 0x0000,
    KMOD_LSHIFT= 0x0001,
    KMOD_RSHIFT= 0x0002,
    KMOD_LCTRL   = 0x0040,
    KMOD_RCTRL   = 0x0080,
    KMOD_LALT    = 0x0100,
    KMOD_RALT    = 0x0200,
    KMOD_LMETA   = 0x0400,
    KMOD_RMETA   = 0x0800,
    KMOD_NUM     = 0x1000,
    KMOD_CAPS    = 0x2000,
    KMOD_MODE    = 0x4000,
} SDLMod;
```

## See Also

`SDL_GetModState`

# SDL\_GetKeyName

## Name

SDL\_GetKeyName — Get the name of an SDL virtual keysym

## Synopsis

```
#include "SDL.h"
char *SDL_GetKeyName(SDLKey key);
```

## Description

Returns the SDL-defined name of the SDLKey *key*.

## See Also

SDLKey

# SDL\_EnableUNICODE

## Name

SDL\_EnableUNICODE — Enable UNICODE translation

## Synopsis

```
#include "SDL.h"
int SDL_EnableUNICODE(int enable);
```

## Description

Enables/Disables UNICODE keyboard translation.

If you wish to translate a keysym to its printable representation, you need to enable UNICODE translation using this function (*enable*=0) and then look in the *unicode* member of the SDL\_keysym structure. This value will be zero for keysyms that do not have a printable representation. UNICODE translation is disabled by default as the conversion can cause a slight overhead.

## Return Value

Returns the previous translation mode.

## See Also

SDL\_keysym

# SDL\_EnableKeyRepeat

## Name

SDL\_EnableKeyRepeat — Set keyboard repeat rate.

## Synopsis

```
#include "SDL.h"
int SDL_EnableKeyRepeat(int delay, int interval);
```

## Description

Enables or disables the keyboard repeat rate. *delay* specifies how long the key must be pressed before it begins repeating, it then repeats at the speed specified by *interval*. Both *delay* and *interval* are expressed in milliseconds.

Setting *delay* to 0 disables key repeating completely. Good default values are `SDL_DEFAULT_REPEAT_DELAY` and `SDL_DEFAULT_REPEAT_INTERVAL`.

## Return Value

Returns 0 on success and -1 on failure.

# SDL\_GetMouseState

## Name

SDL\_GetMouseState — Retrieve the current state of the mouse

## Synopsis

```
#include "SDL.h"
Uint8 SDL_GetMouseState(int *x, int *y);
```

## Description

The current button state is returned as a button bitmask, which can be tested using the `SDL_BUTTON(X)` macros, and `x` and `y` are set to the current mouse cursor position. You can pass `NULL` for either `x` or `y`.

## Example

```
SDL_PumpEvents();
if(SDL_GetMouseState(NULL, NULL)&SDL_BUTTON(1))
    printf("Mouse Button 1(left) is pressed.\n");
```

## See Also

SDL\_GetRelativeMouseState, SDL\_PumpEvents

# SDL\_GetRelativeMouseState

## Name

SDL\_GetRelativeMouseState — Retrieve the current state of the mouse

## Synopsis

```
#include "SDL.h"
Uint8 SDL_GetRelativeMouseState(int *x, int *y);
```

## Description

The current button state is returned as a button bitmask, which can be tested using the `SDL_BUTTON(X)` macros, and `x` and `y` are set to the change in the mouse position since the last call to `SDL_GetRelativeMouseState` or since event initialization. You can pass `NULL` for either `x` or `y`.

## See Also

`SDL_GetMouseState`

# SDL\_GetAppState

## Name

SDL\_GetAppState — Get the state of the application

## Synopsis

```
#include "SDL.h"
Uint8 SDL_GetAppState(void);
```

## Description

This function returns the current state of the application. The value returned is a bitwise combination of:

SDL_APPMOUSEFOCUS	The application has mouse focus.
SDL_APPINPUTFOCUS	The application has keyboard focus
SDL_APPACTIVE	The application is visible

## See Also

SDL\_ActiveEvent

# SDL\_JoystickEventState

## Name

SDL\_JoystickEventState — Enable/disable joystick event polling

## Synopsis

```
#include "SDL.h"
int SDL_JoystickEventState(int state);
```

## Description

This function is used to enable or disable joystick event processing. With joystick event processing disabled you will have to update joystick states with `SDL_JoystickUpdate` and read the joystick information manually. *state* is either `SDL_QUERY`, `SDL_ENABLE` or `SDL_IGNORE`.

**Note:** Joystick event handling is preferred

## Return Value

If *state* is `SDL_QUERY` then the current state is returned, otherwise the new processing *state* is returned.

## See Also

SDL Joystick Functions, `SDL_JoystickUpdate`, `SDL_JoyAxisEvent`, `SDL_JoyBallEvent`, `SDL_JoyButtonEvent`, `SDL_JoyHatEvent`

## Chapter 9. Joystick

Joysticks, and other similar input devices, have a very strong role in game playing and SDL provides comprehensive support for them. Axes, Buttons, POV Hats and trackballs are all supported.

Joystick support is initialized by passed the `SDL_INIT_JOYSTICK` flag to `SDL_Init`. Once initialized joysticks must be opened using `SDL_JoystickOpen`.

While using the functions describe in this section may seem like the best way to access and read from joysticks, in most cases they aren't. Ideally joysticks should be read using the event system. To enable this, you must set the joystick event processing state with `SDL_JoystickEventState`. Joysticks must be opened before they can be used of course.

**Note:** If you are *not* handling the joystick via the event queue then you must explicitly request a joystick update by calling `SDL_JoystickUpdate`.

**Note:** Force Feedback is not yet support. Sam (slouken@libsdl.org) is soliciting suggestions from people with force-feedback experience on the best wat to desgin the API.

### SDL\_NumJoysticks

#### Name

`SDL_NumJoysticks` — Count available joysticks.

#### Synopsis

```
#include "SDL.h"
int SDL_NumJoysticks(void);
```

#### Description

Counts the number of joysticks attached to the system.

## **Return Value**

Returns the number of attached joysticks

## **See Also**

SDL\_JoystickName, SDL\_JoystickOpen

# SDL\_JoystickName

## Name

SDL\_JoystickName — Get joystick name.

## Synopsis

```
#include "SDL.h"
const char *SDL_JoystickName(int index);
```

## Description

Get the implementation dependent name of joystick. The *index* parameter refers to the N'th joystick on the system.

## Return Value

Returns a char pointer to the joystick name.

## Examples

```
/* Print the names of all attached joysticks */
int num_joy, i;
num_joy=SDL_NumJoysticks();
printf("%d joysticks found\n", num_joy);
for(i=0;i<num_joy;i++)
    printf("%s\n", SDL_JoystickName(i));
```

## See Also

SDL\_JoystickOpen

# SDL\_JoystickOpen

## Name

SDL\_JoystickOpen — Opens a joystick for use.

## Synopsis

```
#include "SDL.h"
SDL_Joystick *SDL_JoystickOpen(int index);
```

## Description

Opens a joystick for use within SDL. The *index* refers to the N'th joystick in the system. A joystick must be opened before it can be used.

## Return Value

Returns a SDL\_Joystick structure on success. NULL on failure.

## Examples

```
SDL_Joystick *joy;
// Check for joystick
if(SDL_NumJoysticks()>0){
    // Open joystick
    joy=SDL_JoystickOpen(0);

    if(joy)
    {
        printf("Opened Joystick 0\n");
        printf("Name: %s\n", SDL_JoystickName(0));
        printf("Number of Axes: %s\n", SDL_JoystickNumAxes(joy));
        printf("Number of Buttons: %s\n", SDL_JoystickNumButtons(joy));
        printf("Number of Balls: %s\n", SDL_JoystickNumBalls(joy));
    }
    else
        printf("Couldn't open Joystick 0\n");
}
```

```
// Close if opened
if(SDL_JoystickOpened(0))
    SDL_JoystickClose(joy);
}
```

## **See Also**

`SDL_JoystickClose`

# SDL\_JoystickOpened

## Name

SDL\_JoystickOpened — Determine if a joystick has been opened

## Synopsis

```
#include "SDL.h"
int SDL_JoystickOpened(int index);
```

## Description

Determines whether a joystick has already been opened within the application. *index* refers to the N'th joystick on the system.

## Return Value

Returns 1 if the joystick has been opened, or 0 if it has not.

## See Also

SDL\_JoystickOpen, SDL\_JoystickClose

# SDL\_JoystickIndex

## Name

SDL\_JoystickIndex — Get the index of an SDL\_Joystick.

## Synopsis

```
#include "SDL.h"
int SDL_JoystickIndex(SDL_Joystick *joystick);
```

## Description

Returns the index of a given SDL\_Joystick structure.

## Return Value

Index number of the joystick.

## See Also

SDL\_JoystickOpen

# SDL\_JoystickNumAxes

## Name

SDL\_JoystickNumAxes — Get the number of joystick axes

## Synopsis

```
#include "SDL.h"
int SDL_JoystickNumAxes(SDL_Joystick *joystick);
```

## Description

Return the number of axes available from a previously opened SDL\_Joystick.

## Return Value

Number of axes.

## See Also

SDL\_JoystickGetAxis, SDL\_JoystickOpen

# SDL\_JoystickNumBalls

## Name

SDL\_JoystickNumBalls — Get the number of joystick trackballs

## Synopsis

```
#include "SDL.h"
int SDL_JoystickNumBalls(SDL_Joystick *joystick);
```

## Description

Return the number of trackballs available from a previously opened SDL\_Joystick.

## Return Value

Number of trackballs.

## See Also

SDL\_JoystickGetBall, SDL\_JoystickOpen

# SDL\_JoystickNumHats

## Name

SDL\_JoystickNumHats — Get the number of joystick hats

## Synopsis

```
#include "SDL.h"  
int SDL_JoystickNumHats(SDL_Joystick *joystick);
```

## Description

Return the number of hats available from a previously opened SDL\_Joystick.

## Return Value

Number of hats.

## See Also

SDL\_JoystickGetHat, SDL\_JoystickOpen

# SDL\_JoystickNumButtons

## Name

SDL\_JoystickNumButtons — Get the number of joystick buttons

## Synopsis

```
#include "SDL.h"
int SDL_JoystickNumButtons(SDL_Joystick *joystick);
```

## Description

Return the number of buttons available from a previously opened SDL\_Joystick.

## Return Value

Number of buttons.

## See Also

SDL\_JoystickGetButton, SDL\_JoystickOpen

# SDL\_JoystickUpdate

## Name

SDL\_JoystickUpdate — Updates the state of all joysticks

## Synopsis

```
#include "SDL.h"
void SDL_JoystickUpdate(void);
```

## Description

Updates the state(position, buttons, etc.) of all open joysticks. If joystick events have been enabled with `SDL_JoystickEventState` then this is called automatically in the event loop.

## See Also

`SDL_JoystickEventState`

# SDL\_JoystickGetAxis

## Name

SDL\_JoystickGetAxis — Get the current state of an axis

## Synopsis

```
#include "SDL.h"
 Sint16 SDL_JoystickGetAxis(SDL_Joystick *joystick, int axis);
```

## Description

SDL\_JoystickGetAxis returns the current state of the given *axis* on the given *joystick*.

On most modern joysticks the X axis is usually represented by *axis* 0 and the Y axis by *axis* 1. The value returned by SDL\_JoystickGetAxis is a signed integer (-32768 to 32768) representing the current position of the *axis*, it maybe necessary to impose certain tolerances on these values to account for jitter. It is worth noting that some joysticks use axes 2 and 3 for extra buttons.

## Return Value

Returns a 16-bit signed integer representing the current position of the *axis*.

## Examples

```
Sint16 x_move, y_move;
SDL_Joystick *joy1;
.
.
x_move=SDL_JoystickGetAxis(joy1, 0);
y_move=SDL_JoystickGetAxis(joy1, 1);
```

*SDL\_JoystickGetAxis*

# SDL\_JoystickGetHat

## Name

SDL\_JoystickGetHat — Get the current state of a joystick hat

## Synopsis

```
#include "SDL.h"
Uint8 SDL_JoystickGetHat(SDL_Joystick *joystick, int hat);
```

## Description

SDL\_JoystickGetHat returns the current state of the given *hat* on the given *joystick*.

## Return Value

The current state is returned as a Uint8 which is defined as an OR'd combination of one or more of the following

```
SDL_HAT_CENTERED
SDL_HAT_UP
SDL_HAT_RIGHT
SDL_HAT_DOWN
SDL_HAT_LEFT
SDL_HAT_RIGHTUP
SDL_HAT_RIGHTDOWN
SDL_HAT_LEFTUP
SDL_HAT_LEFTDOWN
```

## See Also

## Name

SDL\_JoystickGetButton — Get the current state of a given button on a given joystick

## Synopsis

```
#include "SDL.h"
Uint8 SDL_JoystickGetButton(SDL_Joystick *joystick, int button);
```

## Description

SDL\_JoystickGetButton returns the current state of the given *button* on the given *joystick*.

## Return Value

1 if the button is pressed. Otherwise, 0.

## See Also

SDL\_JoystickNumButtons

# SDL\_JoystickGetBall

## Name

SDL\_JoystickGetBall — Get relative trackball motion

## Synopsis

```
#include "SDL.h"
int SDL_JoystickGetBall(SDL_Joystick *joystick, int ball, int *dx, int *dy);
```

## Description

Get the *ball* axis change.

Trackballs can only return relative motion since the last call to `SDL_JoystickGetBall`, these motion deltas are placed into *dx* and *dy*.

## Return Value

Returns 0 on success or -1 on failure

## Examples

```
int delta_x, delta_y;
SDL_Joystick *joy;
.
.
.
SDL_JoystickUpdate();
if(SDL_JoystickGetBall(joy, 0, &delta_x, &delta_y)==-1)
    printf("TrackBall Read Error!\n");
printf("Trackball Delta- X:%d, Y:%d\n", delta_x, delta_y);
```

# SDL\_JoystickClose

## Name

SDL\_JoystickClose — Closes a previously opened joystick

## Synopsis

```
#include "SDL.h"
void SDL_JoystickClose(SDL_Joystick *joystick);
```

## Description

Close a *joystick* that was previously opened with SDL\_JoystickOpen.

## See Also

SDL\_JoystickOpen, SDL\_JoystickOpened

# Chapter 10. Audio

Sound on the computer is translated from waves that you hear into a series of values, or samples, each representing the amplitude of the wave. When these samples are sent in a stream to a sound card, an approximation of the original wave can be recreated. The more bits used to represent the amplitude, and the greater frequency these samples are gathered, the closer the approximated sound is to the original, and the better the quality of sound.

This library supports both 8 and 16 bit signed and unsigned sound samples, at frequencies ranging from 11025 Hz to 44100 Hz, depending on the underlying hardware. If the hardware doesn't support the desired audio format or frequency, it can be emulated if desired (See `SDL_OpenAudio()`)

A commonly supported audio format is 16 bits per sample at 22050 Hz.

## SDL\_AudioSpec

### Name

SDL\_AudioSpec — Audio Specification Structure

### Structure Definition

```
typedef struct{
    int freq;
    Uint16 format;
    Uint8 channels;
    Uint8 silence;
    Uint16 samples;
    Uint32 size;
    void (*callback)(void *userdata, Uint8 *stream, int len);
    void *userdata;
} SDL_AudioSpec;
```

### Structure Data

<i>freq</i>	Audio frequency in samples per second
<i>format</i>	Audio data format
<i>channels</i>	Number of channels: 1 mono, 2 stereo
<i>silence</i>	Audio buffer silence value (calculated)
<i>samples</i>	Audio buffer size in samples

<i>size</i>	Audio buffer size in bytes (calculated)
<i>callback(..)</i>	Callback function for filling the audio buffer
<i>userdata</i>	Pointer the user data which is passed to the callback function

## Description

The SDL\_AudioSpec structure is used to describe the format of some audio data. This structure is used by SDL\_OpenAudio and SDL\_LoadWAV. While all fields are used by SDL\_OpenAudio only *freq*, *format*, *samples* and *channels* are used by SDL\_LoadWAV. We will detail these common members here.

<i>freq</i>	The number of samples sent to the sound device every second. Common values are 11025, 22050 and 44100. The higher the better.
-------------	---

*format*

Specifies the size and type of each sample element AUDIO\_U8

Unsigned 8-bit samples

AUDIO\_S8

Signed 8-bit samples

AUDIO\_U16 or AUDIO\_U16LSB

Unsigned 16-bit little-endian samples

AUDIO\_S16 or AUDIO\_S16LSB

Signed 16-bit little-endian samples

AUDIO\_U16MSB

Unsigned 16-bit big-endian samples

AUDIO\_S16MSB

Signed 16-bit big-endian samples

AUDIO\_U16SYS

Either AUDIO\_U16LSB or AUDIO\_U16MSB depending on your systems endianness

AUDIO\_S16SYS

Either AUDIO\_S16LSB or AUDIO\_S16MSB depending on your systems endianness

*channels*

The number of separate sound channels. 1 is mono (single channel), 2 is stereo (dual channel).

*samples*

When used with `SDL_OpenAudio` this refers to the size of the audio buffer in samples. A sample a chunk of audio data of the size specified in *format* multiplied by the number of channels. When the `SDL_AudioSpec` is used with `SDL_LoadWAV` *samples* is set to 4096.

## See Also

`SDL_OpenAudio`, `SDL_LoadWAV`

# SDL\_OpenAudio

## Name

SDL\_OpenAudio — Opens the audio device with the desired parameters.

## Synopsis

```
#include "SDL.h"
int SDL_OpenAudio(SDL_AudioSpec *desired, SDL_AudioSpec *obtained);
```

## Description

This function opens the audio device with the *desired* parameters, and returns 0 if successful, placing the actual hardware parameters in the structure pointed to by *obtained*. If *obtained* is NULL, the audio data passed to the callback function will be guaranteed to be in the requested format, and will be automatically converted to the hardware audio format if necessary. This function returns -1 if it failed to open the audio device, or couldn't set up the audio thread.

To open the audio device a *desired* SDL\_AudioSpec must be created.

```
SDL_AudioSpec *desired;
.
.
desired=(SDL_AudioSpec *)malloc(sizeof(SDL_AudioSpec));
```

You must then fill this structure with your desired audio specifications.

desired->*freq*

The desired audio frequency in samples-per-second.

desired->*format*

The desired audio format (see SDL\_AudioSpec)

desired->*samples*

The desired size of the audio buffer in samples. This number should be a power of two, and may be adjusted by the audio driver to a value more suitable for the hardware. Good values seem to range between 512 and 8192 inclusive, depending on the application and CPU speed. Smaller values yield faster response time, but can lead to underflow if the application is doing heavy processing and cannot fill the audio buffer in time. A stereo sample consists of both right

and left channels in LR ordering. Note that the number of samples is directly related to time by the following formula:  $ms = (samples * 1000) / freq$

desired->*callback*

This should be set to a function that will be called when the audio device is ready for more data. It is passed a pointer to the audio buffer, and the length in bytes of the audio buffer. This function usually runs in a separate thread, and so you should protect data structures that it accesses by calling `SDL_LockAudio` and `SDL_UnlockAudio` in your code. The callback prototype is:

```
void callback(void *userdata, Uint8 *stream, int len);
```

*userdata* is the pointer stored in *userdata* field of the `SDL_AudioSpec`. *stream* is a pointer to the audio buffer you want to fill with information and *len* is the length of the audio buffer in bytes.

desired->*userdata*

This pointer is passed as the first parameter to the *callback* function.

`SDL_OpenAudio` reads these fields from the *desired* `SDL_AudioSpec` structure pass to the function and attempts to find an audio configuration matching your *desired*. As mentioned above, if the *obtained* parameter is NULL then SDL will convert from your *desired* audio settings to the hardware settings as it plays.

If *obtained* is NULL then the *desired* `SDL_AudioSpec` is your working specification, otherwise the *obtained* `SDL_AudioSpec` becomes the working specification and the *desired* specification can be deleted. The data in the working specification is used when building `SDL_AudioCVT`'s for converting loaded data to the hardware format.

`SDL_OpenAudio` calculates the *size* and *silence* fields for both the *desired* and *obtained* specifications. The *size* field stores the total size of the audio buffer in bytes, while the *silence* stores the value used to represent silence in the audio buffer

The audio device starts out playing *silence* when it's opened, and should be enabled for playing by calling `SDL_PauseAudio(0)` when you are ready for your audio *callback* function to be called. Since the audio driver may modify the requested *size* of the audio buffer, you should allocate any local mixing buffers after you open the audio device.

## Examples

```
/* Prototype of our callback function */
void my_audio_callback(void *userdata, Uint8 *stream, int len);

/* Open the audio device */
SDL_AudioSpec *desired, *obtained;
SDL_AudioSpec *hardware_spec;
```

```

/* Allocate a desired SDL_AudioSpec */
desired=(SDL_AudioSpec *)malloc(sizeof(SDL_AudioSpec));

/* Allocate space for the obtained SDL_AudioSpec */
obtained=(SDL_AudioSpec *)malloc(sizeof(SDL_AudioSpec));

/* 22050Hz - FM Radio quality */
desired->freq=22050;

/* 16-bit signed audio */
desired->format=AUDIO_S16LSB;

/* Large audio buffer reduces risk of dropouts but increases response time */
desired->samples=8192;

/* Our callback function */
desired->callback=my_audio_callback;

desired->userdata=NULL;

/* Open the audio device */
if ( SDL_OpenAudio(desired, obtained) < 0 ){
    fprintf(stderr, "Couldn't open audio: %s\n", SDL_GetError());
    exit(-1);
}
/* desired spec is no longer needed */
free(desired);
hardware_spec=obtained;
.
.
/* Prepare callback for playing */
.
.
.
/* Start playing */
SDL_PauseAudio(0);

```

# SDL\_PauseAudio

## Name

SDL\_PauseAudio — Pauses and unpauses the audio callback processing

## Synopsis

```
#include "SDL.h"
void SDL_PauseAudio(int pause_on);
```

## Description

This function pauses and unpauses the audio callback processing. It should be called with *pause\_on*=0 after opening the audio device to start playing sound. This is so you can safely initialize data for your callback function after opening the audio device. Silence will be written to the audio device during the pause.

# SDL\_LoadWAV

## Name

SDL\_LoadWAV — Load a WAVE file

## Synopsis

```
#include "SDL.h"
SDL_AudioSpec *SDL_LoadWAV(const char *file, SDL_AudioSpec *spec, Uint8
**audio_buf, Uint32 *audio_len);
```

## Description

SDL\_LoadWAV This function loads a *WAVE file* into memory.

If this function succeeds, it returns the given SDL\_AudioSpec, filled with the audio data format of the wave data, and sets *audio\_buf* to a malloc'd buffer containing the audio data, and sets *audio\_len* to the length of that audio buffer, in bytes. You need to free the audio buffer with SDL\_FreeWAV when you are done with it.

This function returns NULL and sets the SDL error message if the wave file cannot be opened, uses an unknown data format, or is corrupt. Currently raw, MS-ADPCM and IMA-ADPCM WAVE files are supported.

## Example

```
SDL_AudioSpec wav_spec;
Uint32 wav_length;
Uint8 *wav_buffer;

/* Load the WAV */
if( SDL_LoadWAV("test.wav", &wav_spec, &wav_buffer, &wav_length) == NULL ){
    fprintf(stderr, "Could not open test.wav: %s\n", SDL_GetError());
    exit(-1);
}
.
.
.
/* Do stuff with the WAV */
.
```

```
.*  
/* Free It */  
SDL_FreeWAV(wav_buffer);
```

## See Also

SDL\_AudioSpec, SDL\_OpenAudio, SDL\_FreeWAV

# SDL\_FreeWAV

## Name

SDL\_FreeWAV — Frees previously opened WAV data

## Synopsis

```
#include "SDL.h"
void SDL_FreeWAV(Uint8 *audio_buf);
```

## Description

After a WAVE file has been opened with `SDL_LoadWAV` its data can eventually be freed with `SDL_FreeWAV`. *audio\_buf* is a pointer to the buffer created by `SDL_LoadWAV`.

## See Also

`SDL_LoadWAV`

# SDL\_AudioCVT

## Name

SDL\_AudioCVT — Audio Conversion Structure

## Structure Definition

```
typedef struct{
    int needed;
    Uint16 src_format;
    Uint16 dest_format;
    double rate_incr;
    Uint8 *buf;
    int len;
    int len_cvt;
    int len_mult;
    double len_ratio;
    void (*filters[10])(struct SDL_AudioCVT *cvt, Uint16 format);
    int filter_index;
} SDL_AudioCVT;
```

## Structure Data

<i>needed</i>	Set to one if the conversion is possible
<i>src_format</i>	Audio format of the source
<i>dest_format</i>	Audio format of the destination
<i>rate_incr</i>	Rate conversion increment
<i>buf</i>	Audio buffer
<i>len</i>	Length of the original audio buffer in bytes
<i>len_cvt</i>	Length of converted audio buffer in bytes (calculated)
<i>len_mult</i>	<i>buf</i> must be <i>len*len_mult</i> bytes in size(calculated)
<i>len_ratio</i>	Final audio size is <i>len*len_ratio</i>
<i>filters[10](..)</i>	Pointers to functions needed for this conversion
<i>filter_index</i>	Current conversion function

## Description

The SDL\_AudioCVT is used to convert audio data between different formats. A SDL\_AudioCVT structure is created with the SDL\_BuildAudioCVT function, while the actual conversion is done by the SDL\_ConvertAudio function.

Many of the fields in the SDL\_AudioCVT structure should be considered private and their function will not be discussed here.

Uint8 \**buf*

This points to the audio data that will be used in the conversion. It is both the source and the destination, which means the converted audio data overwrites the original data. It also means that the converted data may be larger than the original data (if you were converting from 8-bit to 16-bit, for instance), so you must ensure *buf* is large enough. See below.

int *len*

This is the length of the original audio data in bytes.

int *len\_mult*

As explained above, the audio buffer needs to be big enough to store the converted data, which may be bigger than the original audio data. The length of *buf* should be  $len * len\_mult$ .

double *len\_ratio*

When you have finished converting your audio data, you need to know how much of your audio buffer is valid.  $len * len\_ratio$  is the size of the converted audio data in bytes. This is very similar to *len\_mult*, however when the converted audio data is shorter than the original *len\_mult* would be 1. *len\_ratio*, on the other hand, would be a fractional number between 0 and 1.

## See Also

SDL\_BuildAudioCVT, SDL\_ConvertAudio, SDL\_AudioSpec

# SDL\_BuildAudioCVT

## Name

SDL\_BuildAudioCVT — Initializes a SDL\_AudioCVT structure for conversion

## Synopsis

```
#include "SDL.h"
int SDL_BuildAudioCVT(SDL_AudioCVT *cvt, Uint16 src_format, Uint8
src_channels, int src_rate, Uint16 dst_format, Uint8 dst_channels, int
dst_rate);
```

## Description

Before an SDL\_AudioCVT structure can be used to convert audio data it must be initialized with source and destination information.

*src\_format* and *dst\_format* are the source and destination format of the conversion. (For information on audio formats see SDL\_AudioSpec). *src\_channels* and *dst\_channels* are the number of channels in the source and destination formats. Finally, *src\_rate* and *dst\_rate* are the frequency or samples-per-second of the source and destination formats. Once again, see SDL\_AudioSpec.

## Return Values

Returns -1 if the filter could not be built or 1 if it could.

## Examples

See SDL\_ConvertAudio.

## See Also

SDL\_ConvertAudio, SDL\_AudioCVT

# SDL\_ConvertAudio

## Name

SDL\_ConvertAudio — Convert audio data to a desired audio format.

## Synopsis

```
#include "SDL.h"
int SDL_ConvertAudio(SDL_AudioCVT *cvt);
```

## Description

SDL\_ConvertAudio takes one parameter, *cvt*, which was previously initialized. Initializing a SDL\_AudioCVT is a two step process. First of all, the structure must be passed to SDL\_BuildAudioCVT along with source and destination format parameters. Secondly, the *cvt->buf* and *cvt->len* fields must be setup. *cvt->buf* should point to the audio data and *cvt->len* should be set to the length of the audio data in bytes. Remember, the length of the buffer pointed to by *buf* should be *len\*len\_mult* bytes in length.

Once the SDL\_AudioCVT structure is initialized then we can pass it to SDL\_ConvertAudio, which will convert the audio data pointer to by *cvt->buf*. If SDL\_ConvertAudio returned 0 then the conversion was completed successfully, otherwise -1 is returned.

If the conversion completed successfully then the converted audio data can be read from *cvt->buf*. The amount of valid, converted, audio data in the buffer is equal to *cvt->len\*cvt->len\_ratio*.

## Examples

```
/* Converting some WAV data to hardware format */
void my_audio_callback(void *userdata, Uint8 *stream, int len);

SDL_AudioSpec *desired, *obtained;
SDL_AudioSpec wav_spec;
SDL_AudioCVT wav_cvt;
Uint32 wav_len;
Uint8 *wav_buf;
int ret;

/* Allocated audio specs */
desired=(SDL_AudioSpec *)malloc(sizeof(SDL_AudioSpec));
```

```

obtained=(SDL_AudioSpec *)malloc(sizeof(SDL_AudioSpec));

/* Set desired format */
desired->freq=22050;
desired->format=AUDIO_S16LSB;
desired->samples=8192;
desired->callback=my_audio_callback;
desired->userdata=NULL;

/* Open the audio device */
if ( SDL_OpenAudio(desired, obtained) < 0 ){
    fprintf(stderr, "Couldn't open audio: %s\n", SDL_GetError());
    exit(-1);
}

free(desired);

/* Load the test.wav */
if( SDL_LoadWAV("test.wav", &wav_spec, &wav_buf, &wav_len) == NULL ){
    fprintf(stderr, "Could not open test.wav: %s\n", SDL_GetError());
    SDL_CloseAudio();
    free(obtained);
    exit(-1);
}

/* Build AudioCVT */
ret = SDL_BuildAudioCVT(&wav_cvt,
                        wav_spec.format, wav_spec.channels, wav_spec.freq,
                        obtained->format, obtained->channels, obtained->freq);

/* Check that the convert was built */
if(ret==-1){
    fprintf(stderr, "Couldn't build converter!\n");
    SDL_CloseAudio();
    free(obtained);
    SDL_FreeWAV(wav_buf);
}

/* Setup for conversion */
wav_cvt.buf=(Uint8 *)malloc(wav_len*wav_cvt.len_mult);
wav_cvt.len=wav_len;
memcpy(wav_cvt.buf, wav_buf, wav_len);

/* We can delete to original WAV data now */
SDL_FreeWAV(wav_buf);

/* And now we're ready to convert */
SDL_ConvertAudio(&wav_cvt);

```

```
/* do whatever */  
.  
.  
.  
.
```

# SDL\_MixAudio

## Name

SDL\_MixAudio — Mix audio data

## Synopsis

```
#include "SDL.h"
void SDL_MixAudio(Uint8 *dst, Uint8 *src, Uint32 len, int volume);
```

## Description

This function takes two audio buffers of *len* bytes each of the playing audio format and mixes them, performing addition, volume adjustment, and overflow clipping. The *volume* ranges from 0 to SDL\_MIX\_MAXVOLUME and should be set to the maximum value for full audio volume. Note this does not change hardware volume. This is provided for convenience -- you can mix your own audio data.

## See Also

SDL\_OpenAudio

# SDL\_LockAudio

## Name

SDL\_LockAudio — Lock out the callback function

## Synopsis

```
#include "SDL.h"  
void SDL_LockAudio(void);
```

## Description

The lock manipulated by these functions protects the callback function. During a LockAudio period, you can be guaranteed that the callback function is not running. Do not call these from the callback function or you will cause deadlock.

## See Also

SDL\_OpenAudio

# SDL\_UnlockAudio

## Name

SDL\_UnlockAudio — Unlock the callback function

## Synopsis

```
#include "SDL.h"  
void SDL_UnlockAudio(void);
```

## Description

Unlocks a previous SDL\_LockAudio call.

## See Also

# SDL\_CloseAudio

## Name

SDL\_CloseAudio — Shuts down audio processing and closes the audio device.

## Synopsis

```
#include "SDL.h"  
void SDL_CloseAudio(void);
```

## Description

This function shuts down audio processing and closes the audio device.

## See Also

SDL\_OpenAudio

# Chapter 11. CD-ROM

SDL supports audio control of up to 32 local CD-ROM drives at once.

You use this API to perform all the basic functions of a CD player, including listing the tracks, playing, stopping, and ejecting the CD-ROM. (Currently, multi-changer CD drives are not supported.)

Before you call any of the SDL CD-ROM functions, you must first call `SDL_Init(SDL_INIT_CDROM)`, which scans the system for CD-ROM drives, and sets the program up for audio control. Check the return code, which should be 0, to see if there were any errors in starting up.

After you have initialized the library, you can find out how many drives are available using the `SDL_CNumDrives()` function. The first drive listed is the system default CD-ROM drive. After you have chosen a drive, and have opened it with `SDL_CDOpen()`, you can check the status and start playing if there's a CD in the drive.

A CD-ROM is organized into one or more tracks, each consisting of a certain number of "frames". Each frame is ~2K in size, and at normal playing speed, a CD plays 75 frames per second. SDL works with the number of frames on a CD, but this can easily be converted to the more familiar minutes/seconds format by using the `FRAMES_TO_MSF()` macro.

## SDL\_CNumDrives

### Name

`SDL_CNumDrives` — Returns the number of CD-ROM drives on the system.

### Synopsis

```
#include "SDL.h"
int  SDL_CNumDrives(void);
```

### Description

Returns the number of CD-ROM drives on the system.

## **See Also**

`SDL_CDOpen`

# SDL\_CDName

## Name

SDL\_CDName — Returns a human-readable, system-dependent identifier for the CD-ROM.

## Synopsis

```
#include "SDL.h"
const char *SDL_CDName(int drive);
```

## Description

Returns a human-readable, system-dependent identifier for the CD-ROM. *drive* is the index of the drive. Drive indices start to 0 and end at `SDL_CNumDrives()-1`.

## Examples

- `"/dev/cdrom"`
- `"E:"`
- `"/dev/disk/ide/1/master"`

## See Also

`SDL_CNumDrives`

# SDL\_CDOpen

## Name

SDL\_CDOpen — Opens a CD-ROM drive for access.

## Synopsis

```
#include "SDL.h"
SDL_CD *SDL_CDOpen(int drive);
```

## Description

Opens a CD-ROM drive for access. It returns a SDL\_CD structure on success, or NULL if the drive was invalid or busy. This newly opened CD-ROM becomes the default CD used when other CD functions are passed a NULL CD-ROM handle.

Drives are numbered starting with 0. Drive 0 is the system default CD-ROM.

## Examples

```
SDL_CD *cdrom;
int cur_track;
int min, sec, frame;
SDL_Init(SDL_INIT_CDROM);
atexit(SDL_Quit);

/* Check for CD drives */
if(!SDL_CDNumDrives()){
    /* None found */
    fprintf(stderr, "No CDROM devices available\n");
    exit(-1);
}

/* Open the default drive */
cdrom=SDL_CDOpen(0);

/* Did it open? Check if cdrom is NULL */
if(!cdrom){
    fprintf(stderr, "Couldn't open drive: %s\n", SDL_GetError());
    exit(-1);
}
```

```
}

/* Print Volume info */
printf("Name: %s\n", SDL_CDName(0));
printf("Tracks: %d\n", cdrom->numtracks);
for(cur_track=0;cur_track < cdrom->numtracks; cur_track++){
    FRAMES_TO_MS(cdrom->track[cur_track].length, &min, &sec, &frame);
    printf("\tTrack %d: Length %d:%d\n", cur_track, min, sec);
}

SDL_CDClose(cdrom);
```

## See Also

SDL\_CD, SDL\_CDtrack, SDL\_CDClose

# SDL\_CDStatus

## Name

SDL\_CDStatus — Returns the current status of the given drive.

## Synopsis

```
#include "SDL.h"
CDstatus SDL_CDStatus(SDL_CD *cdrom);
/* Given a status, returns true if there's a disk in the drive */
#define CD_INDRIVE(status)      ((int)status > 0)
```

## Description

This function returns the current status of the given drive. Status is described like so:

```
typedef enum {
    CD_TRAYEMPTY,
    CD_STOPPED,
    CD_PLAYING,
    CD_PAUSED,
    CD_ERROR = -1
} CDstatus;
```

If the drive has a CD in it, the table of contents of the CD and current play position of the CD will be stored in the SDL\_CD structure.

The macro CD\_INDRIVE is provided for convenience, and given a status returns true if there's a disk in the drive.

**Note:** SDL\_CDStatus also updates the SDL\_CD structure passed to it.

## Example

```
int playTrack(int track)
{
```

```

int playing = 0;

if ( CD_INDRIVE(SDL_CDStatus(cdrom)) ) {
    /* clamp to the actual number of tracks on the CD */
    if (track >= cdrom->numtracks) {
        track = cdrom->numtracks-1;
    }

    if ( SDL_CDPlayTracks(cdrom, track, 0, 1, 0) == 0 ) {
        playing = 1;
    }
}
return playing;
}

```

## See Also

SDL\_CD

# SDL\_CDPlay

## Name

SDL\_CDPlay — Play a CD

## Synopsis

```
#include "SDL.h"
int SDL_CDPlay(SDL_CD *cdrom, int start, int length);
```

## Description

Plays the given *cdrom*, starting a frame *start* for *length* frames.

## Return Values

Returns 0 on success, or -1 on an error.

## See Also

SDL\_CDPlayTracks, SDL\_CDStop

# SDL\_CDPlayTracks

## Name

SDL\_CDPlayTracks — Play the given CD track(s)

## Synopsis

```
#include "SDL.h"
int SDL_CDPlayTracks(SDL_CD *cdrom, int start_track, int start_frame, int
ntracks, int nframes);
```

## Description

SDL\_CDPlayTracks plays the given CD starting at track *start\_track*, for *ntracks* tracks. *start\_frame* is the frame offset, from the beginning of the *start\_track*, at which to start. *nframes* is the frame offset, from the beginning of the last track (*start\_track+ntracks*), at which to end playing.

SDL\_CDPlayTracks should only be called after calling SDL\_CDStatus to get track information about the CD.

**Note:** Data tracks are ignored.

## Return Value

Returns 0, or -1 if there was an error.

## Examples

```
/* assuming cdrom is a previously opened device */
/* Play the entire CD */
if(CD_INDRIVE(SDL_CDStatus(cdrom)))
    SDL_CDPlayTracks(cdrom, 0, 0, 0, 0);

/* Play the first track */
```

```
if(CD_INDRIVE(SDL_CDStatus(cdrom)))
    SDL_CDPlayTracks(cdrom, 0, 0, 1, 0);

/* Play first 15 seconds of the 2nd track */
if(CD_INDRIVE(SDL_CDStatus(cdrom)))
    SDL_CDPlayTracks(cdrom, 1, 0, 0, CD_FPS*15);
```

void SDL_CDClose(SDL_CD *cdrom);
```

## Description

Closes the given *cdrom* handle.

## See Also

SDL\_CDOpen, SDL\_CD

# SDL\_CD

## Name

SDL\_CD — CDROM Drive Information

## Structure Definition

```
typedef struct{
    int id;
    CDstatus status;
    int numtracks;
    int cur_track;
    int cur_frame;
    SDL_CDtrack track[SDL_MAX_TRACKS+1];
} SDL_CD;
```

## Structure Data

<i>id</i>	Private drive identifier
<i>status</i>	Drive status
<i>numtracks</i>	Number of tracks on the CD
<i>cur_track</i>	Current track
<i>cur_frame</i>	Current frame offset within the track
<i>track</i> [SDL_MAX_TRACKS+1]	Array of track descriptions. (see SDL_CDtrack)

## Description

An SDL\_CD structure is returned by `SDL_CDOpen`. It represents an opened CDROM device and stores information on the layout of the tracks on the disc.

A frame is the base data unit of a CD. `CD_FPS` frames is equal to 1 second of music. SDL provides two macros for converting between time and frames: `FRAMES_TO_MSF(f, M, S, F)` and `MSF_TO_FRAMES`.

## Examples

```
int min, sec, frame;
int frame_offset;
```

```
FRAMES_TO_MS(cdrom->cur_frame, &min, &sec, &frame);  
printf("Current Position: %d minutes, %d seconds, %d frames\n", min, sec, frame);  
  
frame_offset=MSF_TO_FRAMES(min, sec, frame);
```

## See Also

SDL\_CDOpen, SDL\_CDtrack

# SDL\_CDtrack

## Name

SDL\_CDtrack — CD Track Information Structure

## Structure Definition

```
typedef struct{
    Uint8 id;
    Uint8 type;
    Uint32 length;
    Uint32 offset;
} SDL_CDtrack;
```

## Structure Data

<i>id</i>	Track number (0-99)
<i>type</i>	SDL_AUDIO_TRACK or SDL_DATA_TRACK
<i>length</i>	Length, in frames, of this track
<i>offset</i>	Frame offset to the beginning of this track

## Description

SDL\_CDtrack stores data on each track on a CD, its fields should be pretty self explanatory. It is a member a the SDL\_CD structure.

**Note:** Frames can be converted to standard timings. There are CD\_FPS frames per second, so `SDL_CDtrack.length/CD_FPS=length_in_seconds`.

# Chapter 12. Multi-threaded Programming

SDL provides functions for creating threads, mutexes, semaphores and condition variables.

In general, you must be very aware of concurrency and data integrity issues when writing multi-threaded programs. Some good guidelines include:

- Don't call SDL video/event functions from separate threads
- Don't use any library functions in separate threads
- Don't perform any memory management in separate threads
- Lock global variables which may be accessed by multiple threads
- Never terminate threads, always set a flag and wait for them to quit
- Think very carefully about all possible ways your code may interact

**Note:** SDL's threading is not implemented on MacOS, due to that lack of preemptive thread support (eck!)

## SDL\_CreateThread

### Name

SDL\_CreateThread — Creates a new thread of execution that shares its parent's properties.

### Synopsis

```
#include "SDL.h"
#include "SDL_thread.h"
SDL_Thread *SDL_CreateThread(int (*fn)(void *), void *data);
```

## Description

`SDL_CreateThread` creates a new thread of execution that shares all of its parent's global memory, signal handlers, file descriptors, etc, and runs the function *fn* passed the void pointer *data*. The thread quits when this function returns.

## See Also

`SDL_KillThread`

# SDL\_ThreadID

## Name

SDL\_ThreadID — Get the 32-bit thread identifier for the current thread.

## Synopsis

```
#include "SDL.h"  
#include "SDL_thread.h"  
Uint32 SDL_ThreadID(void);
```

## Description

Get the 32-bit thread identifier for the current thread.

# SDL\_GetThreadID

## Name

SDL\_GetThreadID — Get the SDL thread ID of a SDL\_Thread

## Synopsis

```
#include "SDL.h"  
#include "SDL_thread.h"  
Uint32 SDL_GetThreadID(SDL_Thread *thread);
```

## Description

Returns the ID of a SDL\_Thread created by SDL\_CreateThread.

## See Also

SDL\_CreateThread

# SDL\_WaitThread

## Name

SDL\_WaitThread — Wait for a thread to finish.

## Synopsis

```
#include "SDL.h"  
#include "SDL_thread.h"  
void SDL_WaitThread(SDL_Thread *thread, int *status);
```

## Description

Wait for a thread to finish (timeouts are not supported).

## Return Value

The return code for the thread function is placed in the area pointed to by *status*, if *status* is not NULL.

## See Also

SDL\_CreateThread

# SDL\_KillThread

## Name

SDL\_KillThread — Gracelessly terminates the thread.

## Synopsis

```
#include "SDL.h"  
#include "SDL_thread.h"  
void SDL_KillThread(SDL_Thread *thread);
```

## Description

SDL\_KillThread gracelessly terminates the thread associated with *thread*. If possible, you should use some other form of IPC to signal the thread to quit.

## See Also

SDL\_CreateThread, SDL\_WaitThread

# SDL\_CreateMutex

## Name

SDL\_CreateMutex — Create a mutex

## Synopsis

```
#include "SDL.h"
#include "SDL_thread.h"
SDL_mutex *SDL_CreateMutex(void);
```

## Description

Create a new, unlocked mutex.

## Examples

```
SDL_mutex *mut;

mut=SDL_CreateMutex();
.
.
if(SDL_mutexP(mut)==-1){
    fprintf(stderr, "Couldn't lock mutex\n");
    exit(-1);
}
.
/* Do stuff while mutex is locked */
.
.
if(SDL_mutexV(mut)==-1){
    fprintf(stderr, "Couldn't unlock mutex\n");
    exit(-1);
}

SDL_DestroyMutex(mut);
```

## See Also

SDL\_mutexP, SDL\_mutexV, SDL\_DestroyMutex

# SDL\_DestroyMutex

## Name

SDL\_DestroyMutex — Destroy a mutex

## Synopsis

```
#include "SDL.h"  
#include "SDL_thread.h"  
void SDL_DestroyMutex(SDL_mutex *mutex);
```

## Description

Destroy a previously created mutex.

## See Also

SDL\_CreateMutex

# SDL\_mutexP

## Name

SDL\_mutexP — Lock a mutex

## Synopsis

```
#include "SDL.h"
#include "SDL_thread.h"
int SDL_mutexP(SDL_mutex *mutex);
```

## Description

Locks the *mutex*, which was previously created with `SDL_CreateMutex`. If the mutex is already locked then `SDL_mutexP` will not return until it is unlocked. Returns 0 on success, or -1 on an error.

SDL also defines a macro `#define SDL_LockMutex(m) SDL_mutexP(m)`.

## See Also

`SDL_CreateMutex`, `SDL_mutexV`

# SDL\_mutexV

## Name

SDL\_mutexV — Unlock a mutex

## Synopsis

```
#include "SDL.h"
#include "SDL_thread.h"
int SDL_mutexV(SDL_mutex *mutex);
```

## Description

Unlocks the *mutex*, which was previously created with `SDL_CreateMutex`. Returns 0 on success, or -1 on an error.

SDL also defines a macro `#define SDL_UnlockMutex(m) SDL_mutexV(m)`.

## See Also

`SDL_CreateMutex`, `SDL_mutexP`

# SDL\_CreateSemaphore

## Name

SDL\_CreateSemaphore — Creates a new semaphore and assigns an initial value to it.

## Synopsis

```
#include "SDL.h"
#include "SDL_thread.h"
SDL_sem *SDL_CreateSemaphore(Uint32 initial_value);
```

## Description

SDL\_CreateSemaphore() creates a new semaphore and initializes it with the value *initial\_value*. Each locking operation on the semaphore by SDL\_SemWait, SDL\_SemTryWait or SDL\_SemWaitTimeout will atomically decrement the semaphore value. The locking operation will be blocked if the semaphore value is not positive (greater than zero). Each unlock operation by SDL\_SemPost will atomically increment the semaphore value.

## Return Value

Returns a pointer to an initialized semaphore or NULL if there was an error.

## Examples

```
SDL_sem *my_sem;

my_sem = SDL_CreateSemaphore(INITIAL_SEM_VALUE);

if (my_sem == NULL) {
    return CREATE_SEM_FAILED;
}
```

## **See Also**

SDL\_DestroySemaphore, SDL\_SemWait, SDL\_SemTryWait, SDL\_SemWaitTimeout,  
SDL\_SemPost, SDL\_SemValue

# SDL\_DestroySemaphore

## Name

SDL\_DestroySemaphore — Destroys a semaphore that was created by SDL\_CreateSemaphore.

## Synopsis

```
#include "SDL.h"
#include "SDL_thread.h"
void SDL_DestroySemaphore(SDL_sem *sem);
```

## Description

SDL\_DestroySemaphore destroys the semaphore pointed to by *sem* that was created by SDL\_CreateSemaphore. It is not safe to destroy a semaphore if there are threads currently blocked waiting on it.

## Examples

```
if (my_sem != NULL) {
    SDL_DestroySemaphore(my_sem);
    my_sem = NULL;
}
```

## See Also

SDL\_CreateSemaphore, SDL\_SemWait, SDL\_SemTryWait, SDL\_SemWaitTimeout, SDL\_SemPost, SDL\_SemValue

# SDL\_SemWait

## Name

`SDL_SemWait` — Lock a semaphore and suspend the thread if the semaphore value is zero.

## Synopsis

```
#include "SDL.h"
#include "SDL_thread.h"
int SDL_SemWait(SDL_sem *sem);
```

## Description

`SDL_SemWait()` suspends the calling thread until either the semaphore pointed to by *sem* has a positive value, the call is interrupted by a signal or error. If the call is successful it will atomically decrement the semaphore value.

After `SDL_SemWait()` is successful, the semaphore can be released and its count atomically incremented by a successful call to `SDL_SemPost`.

## Return Value

Returns 0 if successful or -1 if there was an error (leaving the semaphore unchanged).

## Examples

```
if (SDL_SemWait(my_sem) == -1) {
    return WAIT_FAILED;
}

...

SDL_SemPost(my_sem);
```

## **See Also**

SDL\_CreateSemaphore, SDL\_DestroySemaphore, SDL\_SemTryWait, SDL\_SemWaitTimeout, SDL\_SemPost, SDL\_SemValue

# SDL\_SemTryWait

## Name

SDL\_SemTryWait — Attempt to lock a semaphore but don't suspend the thread.

## Synopsis

```
#include "SDL.h"
#include "SDL_thread.h"
int SDL_SemTryWait(SDL_sem *sem);
```

## Description

SDL\_SemTryWait is a non-blocking variant of SDL\_SemWait. If the value of the semaphore pointed to by *sem* is positive it will atomically decrement the semaphore value and return 0, otherwise it will return SDL\_MUTEX\_TIMEOUT instead of suspending the thread.

After SDL\_SemTryWait is successful, the semaphore can be released and its count atomically incremented by a successful call to SDL\_SemPost.

## Return Value

Returns 0 if the semaphore was successfully locked or either SDL\_MUTEX\_TIMEOUT or -1 if the thread would have suspended or there was an error, respectively.

If the semaphore was not successfully locked, the semaphore will be unchanged.

## Examples

```
res = SDL_SemTryWait(my_sem);

if (res == SDL_MUTEX_TIMEOUT) {
    return TRY_AGAIN;
}
if (res == -1) {
    return WAIT_ERROR;
}
```

...

```
SDL_SemPost(my_sem);
```

## See Also

SDL\_CreateSemaphore, SDL\_DestroySemaphore, SDL\_SemWait, SDL\_SemWaitTimeout, SDL\_SemPost, SDL\_SemValue

# SDL\_SemWaitTimeout

## Name

SDL\_SemWaitTimeout — Lock a semaphore, but only wait up to a specified maximum time.

## Synopsis

```
#include "SDL.h"
#include "SDL_thread.h"
int SDL_SemWaitTimeout(SDL_sem *sem, Uint32 timeout);
```

## Description

SDL\_SemWaitTimeout() is a variant of SDL\_SemWait with a maximum timeout value. If the value of the semaphore pointed to by *sem* is positive (greater than zero) it will atomically decrement the semaphore value and return 0, otherwise it will wait up to *timeout* milliseconds trying to lock the semaphore. This function is to be avoided if possible since on some platforms it is implemented by polling the semaphore every millisecond in a busy loop.

After SDL\_SemWaitTimeout() is successful, the semaphore can be released and its count atomically incremented by a successful call to SDL\_SemPost.

## Return Value

Returns 0 if the semaphore was successfully locked or either SDL\_MUTEX\_TIMEOUT or -1 if the timeout period was exceeded or there was an error, respectively.

If the semaphore was not successfully locked, the semaphore will be unchanged.

## Examples

```
res = SDL_SemWaitTimeout(my_sem, WAIT_TIMEOUT_MILLISEC);

if (res == SDL_MUTEX_TIMEOUT) {
    return TRY_AGAIN;
}
if (res == -1) {
    return WAIT_ERROR;
}
```

```
}  
  
...  
  
SDL_SemPost(my_sem);
```

## See Also

SDL\_CreateSemaphore, SDL\_DestroySemaphore, SDL\_SemWait, SDL\_SemTryWait,  
SDL\_SemPost, SDL\_SemValue

# SDL\_SemPost

## Name

SDL\_SemPost — Unlock a semaphore.

## Synopsis

```
#include "SDL.h"
#include "SDL_thread.h"
int SDL_SemPost(SDL_sem *sem);
```

## Description

SDL\_SemPost unlocks the semaphore pointed to by *sem* and atomically increments the semaphores value. Threads that were blocking on the semaphore may be scheduled after this call succeeds.

SDL\_SemPost should be called after a semaphore is locked by a successful call to SDL\_SemWait, SDL\_SemTryWait or SDL\_SemWaitTimeout.

## Return Value

Returns 0 if successful or -1 if there was an error (leaving the semaphore unchanged).

## Examples

```
SDL_SemPost(my_sem);
```

## See Also

SDL\_CreateSemaphore, SDL\_DestroySemaphore, SDL\_SemWait, SDL\_SemTryWait, SDL\_SemWaitTimeout, SDL\_SemValue

# SDL\_SemValue

## Name

SDL\_SemValue — Return the current value of a semaphore.

## Synopsis

```
#include "SDL.h"
#include "SDL/SDL_thread.h"
Uint32 SDL_SemValue(SDL_sem *sem);
```

## Description

SDL\_SemValue() returns the current semaphore value from the semaphore pointed to by *sem*.

## Return Value

Returns current value of the semaphore.

## Examples

```
sem_value = SDL_SemValue(my_sem);
```

## See Also

SDL\_CreateSemaphore, SDL\_DestroySemaphore, SDL\_SemWait, SDL\_SemTryWait, SDL\_SemWaitTimeout, SDL\_SemPost

# SDL\_CreateCond

## Name

SDL\_CreateCond — Create a condition variable

## Synopsis

```
#include "SDL.h"
#include "SDL_thread.h"
SDL_cond *SDL_CreateCond(void);
```

## Description

Creates a condition variable.

## Examples

```
SDL_cond *cond;

cond=SDL_CreateCond();
.
.
/* Do stuff */

.
.
SDL_DestroyCond(cond);
```

## See Also

SDL\_DestroyCond, SDL\_CondWait, SDL\_CondSignal

# SDL\_DestroyCond

## Name

SDL\_DestroyCond — Destroy a condition variable

## Synopsis

```
#include "SDL.h"  
#include "SDL_thread.h"  
void SDL_DestroyCond(SDL_cond *cond);
```

## Description

Destroys a condition variable.

## See Also

SDL\_CreateCond

# SDL\_CondSignal

## Name

SDL\_CondSignal — Restart a thread wait on a condition variable

## Synopsis

```
#include "SDL.h"  
#include "SDL_thread.h"  
int SDL_CondSignal(SDL_cond *cond);
```

## Description

Restart one of the threads that are waiting on the condition variable, *cond*. Returns 0 on success of -1 on an error.

## See Also

SDL\_CondWait, SDL\_CondBroadcast

# SDL\_CondBroadcast

## Name

SDL\_CondBroadcast — Restart all threads waiting on a condition variable

## Synopsis

```
#include "SDL.h"  
#include "SDL_thread.h"  
int SDL_CondBroadcast(SDL_cond *cond);
```

## Description

Restarts all threads that are waiting on the condition variable, *cond*. Returns 0 on success, or -1 on an error.

## See Also

SDL\_CondSignal, SDL\_CondWait

# SDL\_CondWait

## Name

SDL\_CondWait — Wait on a condition variable

## Synopsis

```
#include "SDL.h"  
#include "SDL_thread.h"  
int SDL_CondWait(SDL_cond *cond, SDL_mutex *mut);
```

## Description

Wait on the condition variable *cond* and unlock the provided mutex. The mutex must be locked before entering this function. Returns 0 when it is signalled, or -1 on an error.

## See Also

SDL\_CondWaitTimeout, SDL\_CondSignal, SDL\_mutexP

# SDL\_CondWaitTimeout

## Name

SDL\_CondWaitTimeout — Wait on a condition variable, with timeout

## Synopsis

```
#include "SDL.h"
#include "SDL_thread.h"
int SDL_CondWaitTimeout(SDL_cond *cond, SDL_mutex *mutex, Uint32 ms);
```

## Description

Wait on the condition variable *cond* for, at most, *ms* milliseconds. *mut* is unlocked so it must be locked when the function is called. Returns SDL\_MUTEX\_TIMEDOUT if the condition is not signalled in the allotted time, 0 if it was signalled or -1 on an error.

## See Also

SDL\_CondWait

## Chapter 13. Time

SDL provides several cross-platform functions for dealing with time. It provides a way to get the current time, a way to wait a little while, and a simple timer mechanism. These functions give you two ways of moving an object every x milliseconds:

- Use a timer callback function. This may have the bad effect that it runs in a separate thread or uses alarm signals, but it's easier to implement.
- Or you can get the number of milliseconds passed, and move the object if, for example, 30 ms passed.

### SDL\_GetTicks

#### Name

`SDL_GetTicks` — Get the number of milliseconds since the SDL library initialization.

#### Synopsis

```
#include "SDL.h"
Uint32 SDL_GetTicks(void);
```

#### Description

Get the number of milliseconds since the SDL library initialization. Note that this value wraps if the program runs for more than ~49 days.

#### See Also

`SDL_Delay`

# SDL\_Delay

## Name

SDL\_Delay — Wait a specified number of milliseconds before returning.

## Synopsis

```
#include "SDL.h"  
void SDL_Delay(Uint32 ms);
```

## Description

Wait a specified number of milliseconds before returning. SDL\_Delay will wait at *least* the specified time, but possible longer due to OS scheduling.

**Note:** Count on a delay granularity of *at least* 10 ms. Some platforms have shorter clock ticks but this is the most common.

## See Also

SDL\_AddTimer

# SDL\_AddTimer

## Name

`SDL_AddTimer` — Add a timer which will call a callback after the specified number of milliseconds has elapsed.

## Synopsis

```
#include "SDL.h"
SDL_TimerID SDL_AddTimer(Uint32 interval, SDL_NewTimerCallback callback,
void *param);
```

## Callback

```
/* type definition for the "new" timer callback function */
typedef Uint32 (*SDL_NewTimerCallback)(Uint32 interval, void *param);
```

## Description

Adds a callback function to be run after the specified number of milliseconds has elapsed. The callback function is passed the current timer interval and the user supplied parameter from the `SDL_AddTimer` call and returns the next timer interval. If the returned value from the callback is the same as the one passed in, the periodic alarm continues, otherwise a new alarm is scheduled.

To cancel a currently running timer call `SDL_RemoveTimer` with the timer ID returned from `SDL_AddTimer`.

The timer callback function may run in a different thread than your main program, and so shouldn't call any functions from within itself. You may always call `SDL_PushEvent`, however.

The granularity of the timer is platform-dependent, but you should count on it being at least 10 ms as this is the most common number. This means that if you request a 16 ms timer, your callback will run approximately 20 ms later on an unloaded system. If you wanted to set a flag signaling a frame update at 30 frames per second (every 33 ms), you might set a timer for 30 ms (see example below). If you use this function, you need to pass `SDL_INIT_TIMER` to `SDL_Init`.

## Return Value

Returns an ID value for the added timer or NULL if there was an error.

## Examples

```
my_timer_id = SDL_AddTimer((33/10)*10, my_callbackfunc, my_callback_param);
```

## See Also

[SDL\\_RemoveTimer](#), [SDL\\_PushEvent](#)

# SDL\_RemoveTimer

## Name

SDL\_RemoveTimer — Remove a timer which was added with SDL\_AddTimer.

## Synopsis

```
#include "SDL.h"  
SDL_bool SDL_RemoveTimer(SDL_TimerID id);
```

## Description

Removes a timer callback previously added with SDL\_AddTimer.

## Return Value

Returns a boolean value indicating success.

## Examples

```
SDL_RemoveTimer(my_timer_id);
```

## See Also

SDL\_AddTimer

# SDL\_SetTimer

## Name

`SDL_SetTimer` — Set a callback to run after the specified number of milliseconds has elapsed.

## Synopsis

```
#include "SDL.h"
int SDL_SetTimer(Uint32 interval, SDL_TimerCallback callback);
```

## Callback

```
/* Function prototype for the timer callback function */ typedef Uint32
(SDL_TimerCallback)(Uint32 interval);
```

## Description

Set a callback to run after the specified number of milliseconds has elapsed. The callback function is passed the current timer interval and returns the next timer interval. If the returned value is the same as the one passed in, the periodic alarm continues, otherwise a new alarm is scheduled.

To cancel a currently running timer, call `SDL_SetTimer(0, NULL)`;

The timer callback function may run in a different thread than your main constant, and so shouldn't call any functions from within itself.

The maximum resolution of this timer is 10 ms, which means that if you request a 16 ms timer, your callback will run approximately 20 ms later on an unloaded system. If you wanted to set a flag signaling a frame update at 30 frames per second (every 33 ms), you might set a timer for 30 ms (see example below).

If you use this function, you need to pass `SDL_INIT_TIMER` to `SDL_Init()`.

**Note:** This function is kept for compatibility but has been superseded by the new timer functions `SDL_AddTimer` and `SDL_RemoveTimer` which support multiple timers.

## Examples

```
SDL_SetTimer((33/10)*10, my_callback);
```
